

# Time Series Database Interface: R fame (TSfame)

November 2, 2008

## 1 Introduction

The code from the vignette that generates this guide can be loaded into an editor with `edit(vignette("TSfame"))`. This uses the default editor, which can be changed using `options()`. It should be possible to view the pdf version of the guide for this package with `print(vignette("TSfame"))`.

WARNING: running these example will overwrite the fame "testvigFame.db" database.

Once R is started, the functions in this package are made available with

```
> library("TSfame")
```

This will also load required packages *TSdbi*, *DBI*, *fame*, *methods*, and *tframe*. Some examples below also require *zoo*, and *tseries*.

## 2 Using the Database - TSdbi Functions

This section gives several simple examples of putting series on and reading them from the database. (If a large number of series are to be loaded into a database, one would typically do this with a batch process in Fame.) The first thing to do is to establish a connection to the database:

```
> con <- TSconnect("fame", dbname = "testvigFame.db")
```

This puts a series called *vec* on the database and then reads it back.

```
> z <- ts(rnorm(10), start = c(1990, 1), frequency = 1)
> seriesNames(z) <- "vec"
> if (TSexists("vec", con)) TSdelete("vec", con)
> TSput(z, con)
> z <- TSget("vec", con)
```

If the series is printed it is seen to be a "ts" time series with some extra attributes.

*TSput* fails if the series already exists on the *con*, so the above example checks and deletes the series if it already exists. *TSreplace* does not fail if the

series does not yet exist, so examples below use it instead. Several plots below show original data and the data retrieved after it is written to the database. One is added to the original data so that both lines are visible.

And now more examples:

```
> z <- ts(matrix(rnorm(20), 10, 2), start = c(1990, 1), frequency = 1)
> seriesNames(z) <- c("matc1", "matc2")
> TSreplace(z, con)

[1] TRUE

> TSget("matc1", con)

> tfplot(z + 1, TSget(c("matc1", "matc2"), con), lty = c("solid",
    "dashed"), col = c("black", "red"))

```

```
> z <- ts(matrix(rnorm(200), 100, 2), start = c(1995, 1), frequency = 12)
> seriesNames(z) <- c("mat2c1", "mat2c2")
> TSreplace(z, con)

[1] TRUE

> tfplot(z + 1, TSget(c("mat2c1", "mat2c2"), con), lty = c("solid",
  "dashed"), col = c("black", "red"))
```

The following extract information about the series from the database, although not much information has been added for these examples.

```
> TSmeta("mat2c1", con)
> TSmeta("vec", con)
> TSdates("vec", con)
> TSdescription("vec", con)
> TSdoc("vec", con)
```

Below are examples that make more use of *TSdescription* and *codeTSdoc*. Often it is convenient to set the default connection:

```
> options(TSconnection = con)
```

and then the *con* specification can be omitted from the function calls unless another connection is needed. The *con* can still be specified, and some examples below do specify it, just to illustrate the alternative syntax.

```
> z <- TSget("mat2c1")
> TSmeta("mat2c1")
```

```
An object of class "TSmeta"

```

Data documentation can be in two forms, a description specified by *TSdescription* or longer documentation specified by *TSdoc*. These can be added to the time series object, in which case they will be written to the database when *TSput* or *TSreplace* is used to put the series on the database. Alternatively, they can be specified as arguments to *TSput* or *TSreplace*. The description or documentation will be retrieved as part of the series object with *TSget* only if this is specified with the logical arguments *TSdescription* and *TSdoc*. They can also be retrieved directly from the database with the functions *TSdescription* and *TSdoc*.

```

> z <- ts(matrix(rnorm(10), 10, 1), start = c(1990, 1), frequency = 1)
> TSreplace(z, serIDs = "Series1", con)

[1] TRUE

> zz <- TSget("Series1", con)
> TSreplace(z, serIDs = "Series1", con, TSdescription = "short rnorm series",
  TSdoc = "Series created as an example in the vignette.")

[1] TRUE

```

```

> zz <- TSget("Series1", con, TSdescription = TRUE, TSdoc = TRUE)
> start(zz)

[1] 1990    1

> end(zz)

[1] 1999    1

> TSdescription(zz)

[1] "short rnorm series from testvigFame.db retrieved 2008-11-02 21:20:06"

> TSdoc(zz)

[1] "Series created as an example in the vignette."

> TSdescription("Series1", con)

[1] "short rnorm series"

> TSdoc("Series1", con)

[1] "Series created as an example in the vignette."

> z <- ts(rnorm(10), start = c(1990, 1), frequency = 1)
> seriesNames(z) <- "vec"
> TSreplace(z, con)

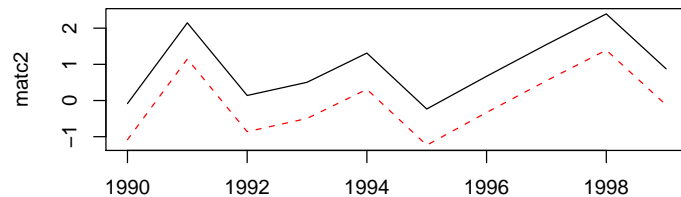

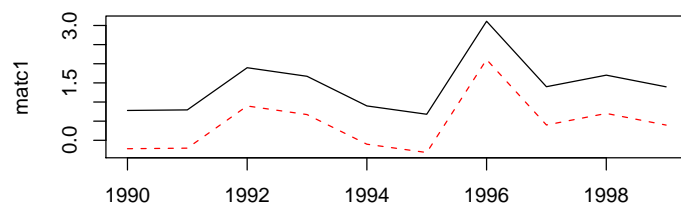

[1] TRUE

> zz <- TSget("vec", con)
> z <- ts(matrix(rnorm(20), 10, 2), start = c(1990, 1), frequency = 1)
> seriesNames(z) <- c("matc1", "matc2")
> TSreplace(z, con)

[1] TRUE

> tfplot(z + 1, TSget(c("matc1", "matc2"), con), lty = c("solid",
  "dashed"), col = c("black", "red"))

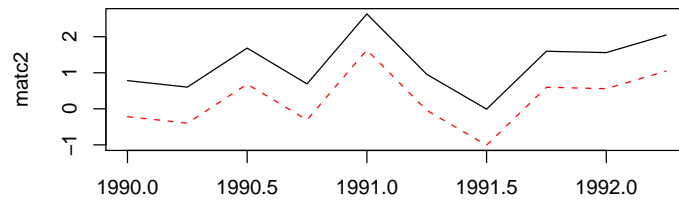

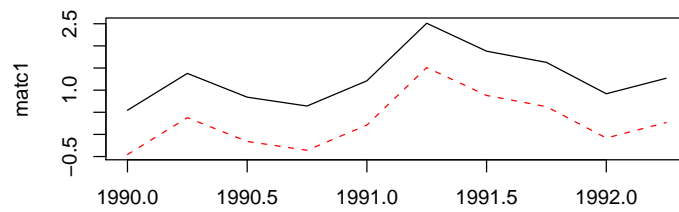

```

```
> z <- ts(matrix(rnorm(20), 10, 2), start = c(1990, 1), frequency = 4)
> seriesNames(z) <- c("matc1", "matc2")
> TSreplace(z, con)

[1] TRUE

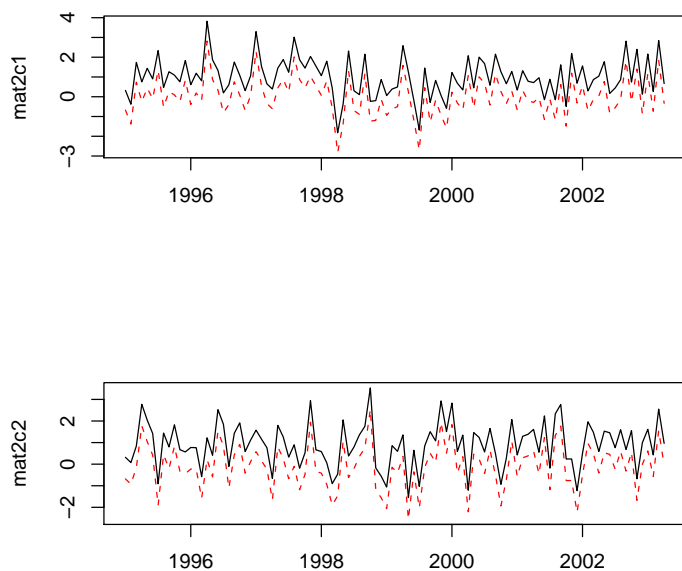

> tfplot(z + 1, TSget(c("matc1", "matc2"), con), lty = c("solid",
  "dashed"), col = c("black", "red"))
```

```
> z <- ts(matrix(rnorm(200), 100, 2), start = c(1995, 1), frequency = 12)
> seriesNames(z) <- c("mat2c1", "mat2c2")
> TSreplace(z, con)

[1] TRUE

> tfplot(z + 1, TSget(c("mat2c1", "mat2c2"), con), lty = c("solid",
  "dashed"), col = c("black", "red"))
```

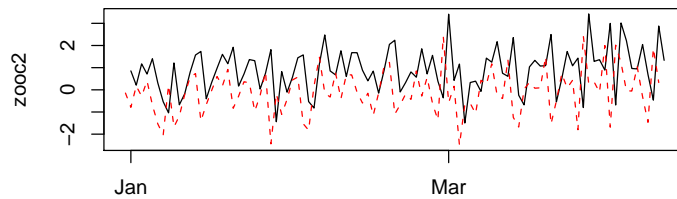

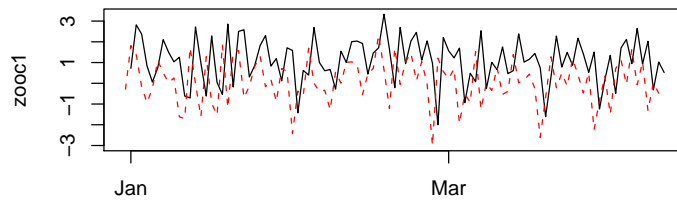

The following examples use dates and times which are not handled by *ts*, so the *zoo* time representation is used.

```
> require("zoo")
> z <- zoo(matrix(rnorm(200), 100, 2), as.Date("1990-01-01") +
  0:99)
> seriesNames(z) <- c("zooc1", "zooc2")
> TSreplace(z, con, Table = "D")

[1] TRUE

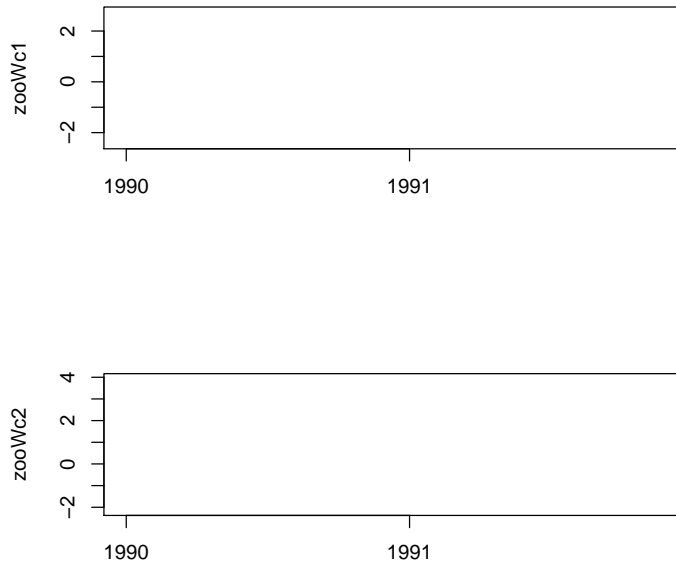

> tfplot(z + 1, TSget(c("zooc1", "zooc2"), con), lty = c("solid",
  "dashed"), col = c("black", "red"))
```

```
> z <- zoo(matrix(rnorm(200), 100, 2), as.Date("1990-01-01") +
  0:99 * 7)
> seriesNames(z) <- c("zooWc1", "zooWc2")
> TSreplace(z, con, Table = "W")

[1] TRUE

> tfplot(z + 1, TSget(c("zooWc1", "zooWc2"), con), col = c("black",
  "red"), lty = c("dashed", "solid"))
```

### 3 Examples Using Web Data

This section illustrates fetching data from a web server and loading it into the database. This would be a very slow way to load a database, but provides examples of different kinds of time series data. The fetching is done with *TShistQuote* which provides a wrapper for *get.hist.quote* from package *tseries* to give syntax consistent with the *TSdbi*.

Fetching data may fail due to lack of an Internet connection or delays.

The connection *con* established above to the database will be used to save data but, to make the use of the two connections more obvious, neither will be set as the default:

```
> options(TSconnection = NULL)
```

Now connect to the web server and fetch data:

```
> require("TShistQuote")
> Yahoo <- TSconnect("histQuote", dbname = "yahoo")
> x <- TSget("^gspc", quote = "Close", con = Yahoo)
> plot(x)
> tfplot(x)
> TSrefperiod(x)
```

```

[1] "Close"

> TSdescription(x)

[1] "^gspc Close from yahoo"

> TSdoc(x)

[1] "^gspc Close from yahoo retrieved 2008-11-02 21:20:16"

```

Then write the data to the local server, specifying table B for business day data (using `TSreplace` in case the series is already there from running this example previously):

```

> TSreplace(x, serIDs = "gspc", Table = "B", con = con)

[1] TRUE

    and check the saved version:

> TSrefperiod(TSget(serIDs = "gspc", con = con))

[1] "daily"

> TSdescription("gspc", con = con)

[1] "NA"

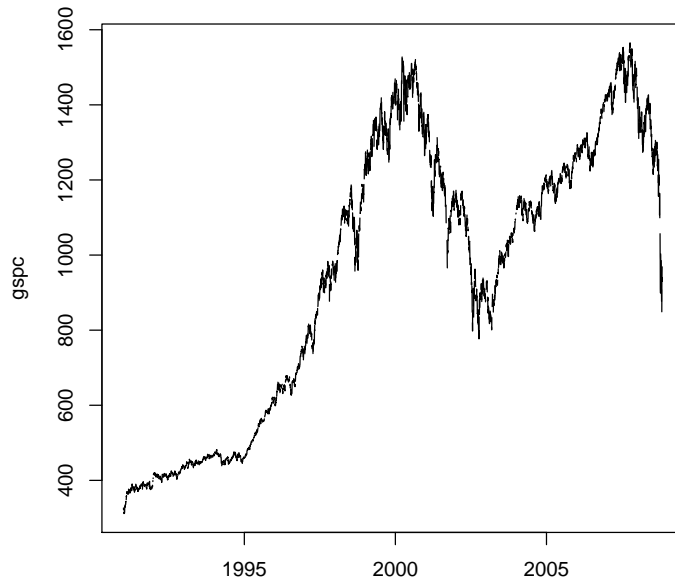

> TSdoc("gspc", con = con)

[1] "NA"

> tfplot(TSget(serIDs = "gspc", con = con))

```

```
> x <- TSget("ibm", quote = c("Close", "Vol"), con = Yahoo)
> TSreplace(x, serIDs = c("ibm.Cl", "ibm.Vol"), con = con, Table = "B",
  TSdescription. = c("IBM Close", "IBM Volume"), TSdoc. = paste(c("IBM Close retrieved on ", Sys.Date()),
    "IBM Volume retrieved on "), Sys.Date()))

[1] TRUE

> z <- TSget(serIDs = c("ibm.Cl", "ibm.Vol"), TSdescription = TRUE,
  TSdoc = TRUE, con = con)
> TSdescription(z)

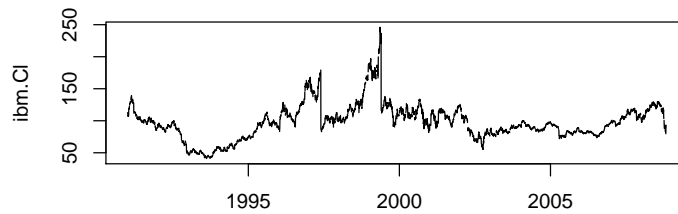

[1] "IBM Close from testvigFame.db retrieved 2008-11-02 21:20:25"
[2] "IBM Volume from testvigFame.db retrieved 2008-11-02 21:20:25"

> TSdoc(z)

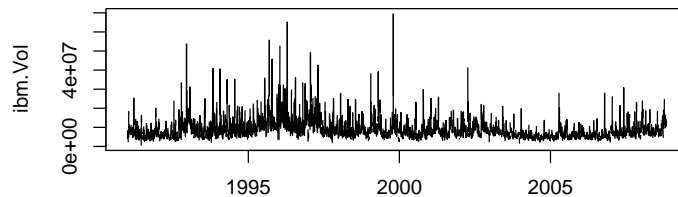

[1] "IBM Close retrieved on 2008-11-02"
[2] "IBM Volume retrieved on 2008-11-02"

> tfplot(z, xlab = TSdoc(z), Title = TSdescription(z))
> tfplot(z, Title = "IBM", start = "2007-01-01")
```

**IBM Close from testvigFame.db retrieved 2008-11-02 21:20:4**  
**IBM Volume from testvigFame.db retrieved 2008-11-02 21:20**

IBM Close retrieved on 2008-11-02

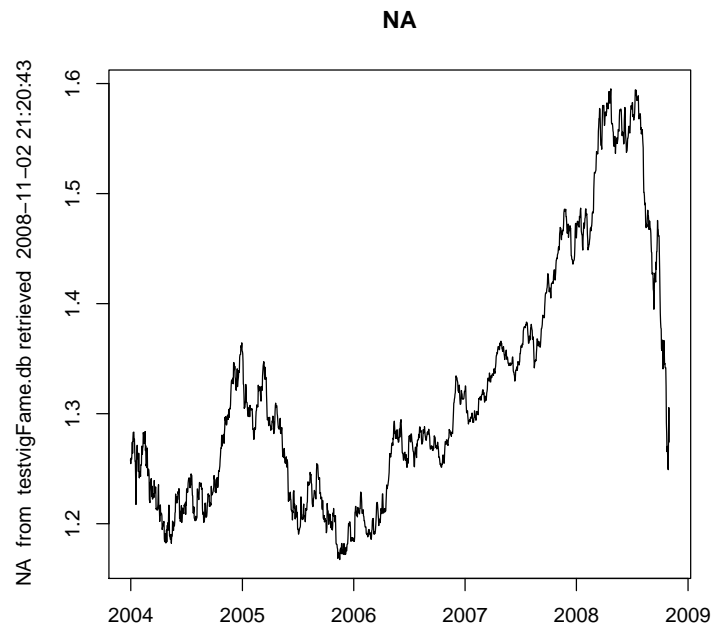

IBM Volume retrieved on 2008-11-02

```
> Oanda <- TSconnect("histQuote", dbname = "oanda")
> x <- TSget("EUR/USD", start = "2004-01-01", con = Oanda)
> TSreplace(x, serIDs = "EURUSD", con = con)
```

[1] TRUE

and check the saved version:

```
> z <- TSget(serIDs = "EURUSD", TSdoc = TRUE, TSdescription = TRUE,
  con = con)
> tfplot(z, Title = TSdoc(z), ylab = TSdescription(z))
> tfplot(z, Title = "EUR/USD", start = "2007-01-01")
> tfplot(z, Title = "EUR/USD", start = "2007-03-01")
> tfplot(z, Title = "EUR/USD", start = Sys.Date() - 14, end = Sys.Date(),
  xlab = format(Sys.Date(), "%Y"))
```

```
> dbDisconnect(con)
> dbDisconnect(Yahoo)
> dbDisconnect(Oanda)
```

Finally, `dbDisconnect` does nothing in `TSfame`, but is provided for compatibility with other packages.

```
> dbDisconnect(con)
> options(TSconnection = NULL)
```
