October 13, 2022

Title The Causal Effects for a Causal Loglinear Model

Description Fitting a causal loglinear model and calculating the causal effects for a causal loglinear model with the multiplicative interaction or without the multiplicative interaction, obtaining the natural direct, indirect and the total effect. It calculates also the cell effect, which is a new interaction effect.

Version 1.0

efflog-package

*The Causal Effects for a Causal Loglinear Model***Description**

Calculate the Causal Effects for a causal loglinear model with the multiplicative interaction or without the multiplicative interaction

Details

Package:	efflog
Type:	Package
Version:	1.0
Date:	2015-07-14
License:	GPL (>=2)

Author(s)

Gloria Gheno <gloriagheno@libero.it>

References

Gheno Gloria (2015), The causal analysis in the loglinear model

cell_effect_mult_or

*Cell effect for loglinear models with the multiplicative interaction***Description**

This function calculates the cell effect using the odds ratio for a loglinear model with the multiplicative interaction and under dummy code parametrization

Usage

```
cell_effect_mult_or(x, y, z, w, q)
```

Arguments

x	it is the parameter $\mu^{Y=1}$
y	it is the parameter $\mu^{X=1, Y=1}$
z	it is the parameter $\mu^{Z=1, Y=1}$
w	it is the parameter $\mu_c^{Z=1}$
q	it is the parameter $\mu^{X=1, Z=1, Y=1}$

Value

`cell_effect_mult_or` returns the cell effect

Author(s)

Gloria Gheno

References

Gheno Gloria (2015),The causal analysis in the loglinear model

Examples

```
cell_effect_mult_or(0.6,0.8,0.5,2,0.6)
```

`cell_effect_or`

Cell effect for loglinear models without the multiplicative interaction

Description

This function calculates the cell effect using the odds ratio for a loglinear model without the multiplicative interaction and under dummy code parametrization

Usage

```
cell_effect_or(x, y, z, w)
```

Arguments

x	it is the parameter $\mu^{Y=1}$
y	it is the parameter $\mu^{X=1,Y=1}$
z	it is the parameter $\mu^{Z=1,Y=1}$
w	it is the parameter $\mu_c^{Z=1}$

Value

`cell_effect_or` returns the cell effect

Author(s)

Gloria Gheno

References

Gheno Gloria (2015),The causal analysis in the loglinear model

Examples

```
cell_effect_or(0.6,0.8,0.5,2)
```

Cloglin

Fitting a causal log-linear model without the multiplicative interaction

Description

Cloglin is used to fit causal log-linear models under dummy code parametrization

Usage

```
Cloglin(table)
```

Arguments

table	it is a table containing the frequency distribution of the variables
-------	--

Value

Cloglin returns the estimated causal parameters of the additive form, their standard errors and their p-values which test the null hypothesis H_0 : parameter=0.

Author(s)

Gloria Gheno

References

Gheno Gloria (2015), The causal analysis in the loglinear model

Examples

```
tableXZY<-data.frame(expand.grid(
  X=factor(c("0","1"),levels=c("0","1")),
  Z=factor(c("0","1"),levels=c("0","1")),
  Y=factor(c("0","1"),levels=c("0","1"))),
  count=c(57,47,21,39,31,40,20,95))
Cloglin(tableXZY)
```

Cloglin_mult*Fitting a causal log-linear model with the multiplicative interaction*

Description

Cloglin_mult is used to fit causal log-linear models and under dummy code parametrization

Usage

```
Cloglin_mult(table)
```

Arguments

table	it is a table containing the frequency distribution of the variables
-------	--

Value

Cloglin_mult returns the estimated causal parameters of the additive form, their standard errors and their p-values which test the null hypothesis H_0 : parameter=0.

Author(s)

Gloria Gheno

References

Gheno Gloria (2015), The causal analysis in the loglinear model

Examples

```
tableXZY<-data.frame(expand.grid(  
  X=factor(c("0","1"),levels=c("0","1")),  
  Z=factor(c("0","1"),levels=c("0","1")),  
  Y=factor(c("0","1"),levels=c("0","1"))),  
  count=c(57,47,21,39,31,40,20,95))  
Cloglin_mult(tableXZY)
```

exp_par

*Fitting causal log-linear models without the multiplicative interaction***Description**

`exp_par` calculates the causal parameters for a causal log-linear model under dummy code parametrization

Usage

```
exp_par(table)
```

Arguments

table	it is a table containing the frequency distribution of the variables
-------	--

Value

`exp_par` returns the estimated causal parameters of the multiplicative form

Author(s)

Gloria Gheno

References

Gheno Gloria (2015), The causal analysis in the loglinear model

Examples

```
tableXZY<-data.frame(expand.grid(
  X=factor(c("0","1"),levels=c("0","1")),
  Z=factor(c("0","1"),levels=c("0","1")),
  Y=factor(c("0","1"),levels=c("0","1"))),
  count=c(57,47,21,39,31,40,20,95))
exp_par(tableXZY)
```

exp_par_mult	<i>Fitting causal log-linear model</i>
--------------	--

Description

exp_par_mult calculates the causal parameters for a causal log-linear model with the multiplicative interaction

Usage

```
exp_par_mult(table)
```

Arguments

table it is a table containing the frequency distribution of the variables

Value

exp_par_mult returns the estimated causal parameters of the multiplicative form

Author(s)

Gloria Gheno

References

Gheno Gloria (2015), The causal analysis in the loglinear model

Examples

```
tableXZY<-data.frame(expand.grid(  
  X=factor(c("0","1"),levels=c("0","1")),  
  Z=factor(c("0","1"),levels=c("0","1")),  
  Y=factor(c("0","1"),levels=c("0","1"))),  
  count=c(57,47,21,39,31,40,20,95))  
exp_par_mult(tableXZY)
```

indirect_effect_or

Indirect effect for loglinear models both with the multiplicative interaction and without it

Description

This function calculates the indirect effect using the odds ratio for any loglinear model and under dummy code parametrization

Usage

```
indirect_effect_or(x, y, z, w, t)
```

Arguments

x	it is the parameter $\mu^{Y=1}$
y	it is the parameter $\mu^{X=1,Y=1}$
z	it is the parameter $\mu^{Z=1,Y=1}$
w	it is the parameter $\mu_c^{Z=1}$
t	it is the parameter $\mu_c^{X=1,Z=1}$

Value

indirect_effect_or returns the indirect effect

Author(s)

Gloria Gheno

References

Gheno Gloria (2015),The causal analysis in the loglinear model

Examples

```
indirect_effect_or(0.6,0.8,0.5,2,0.7)
```

ndirect_effect_mult_or

Natural direct effect for loglinear models with the multiplicative interaction

Description

This function calculates the natural direct effect using the odds ratio for a loglinear model with the multiplicative interaction and under dummy code parametrization

Usage

```
ndirect_effect_mult_or(x, y, z, w, t, q)
```

Arguments

x	it is the parameter $\mu^{Y=1}$
y	it is the parameter $\mu^{X=1,Y=1}$
z	it is the parameter $\mu^{Z=1,Y=1}$
w	it is the parameter $\mu_c^{Z=1}$
t	it is the parameter $\mu_c^{X=1,Z=1}$
q	it is the parameter $\mu^{X=1,Z=1,Y=1}$

Value

ndirect_effect_mult_or returns the natural direct effect

Author(s)

Gloria Gheno

References

Examples

```
ndirect_effect_mult_or(0.6,0.8,0.5,2,0.7,0.6)
```

ndirect_effect_or *Natural direct effect for loglinear models without the multiplicative interaction*

Description

This function calculates the natural direct effect using the odds ratio for a loglinear model without the multiplicative interaction and under dummy code parametrization

Usage

```
ndirect_effect_or(x, y, z, w, t)
```

Arguments

x	it is the parameter $\mu^{Y=1}$
y	it is the parameter $\mu^{X=1,Y=1}$
z	it is the parameter $\mu^{Z=1,Y=1}$
w	it is the parameter $\mu_c^{Z=1}$
t	it is the parameter $\mu_c^{X=1,Z=1}$

Value

ndirect_effect_or returns the natural direct effect

Author(s)

Gloria Gheno

References

Examples

```
#> ndirect_effect_or(0.6,0.8,0.5,2,0.7)
#[1] 0.8039409
```

`total_effect_mult_or` *Total effect for loglinear models with the multiplicative interaction*

Description

This function calculates the total effect using the odds ratio for a loglinear model with the multiplicative interaction and under dummy code parametrization

Usage

```
total_effect_mult_or(x, y, z, w, t, q)
```

Arguments

x	it is the parameter $\mu^{Y=1}$
y	it is the parameter $\mu^{X=1,Y=1}$
z	it is the parameter $\mu^{Z=1,Y=1}$
w	it is the parameter $\mu_c^{Z=1}$
t	it is the parameter $\mu_c^{X=1,Z=1}$
q	it is the parameter $\mu^{X=1,Z=1,Y=1}$

Value

`total_effect_mult_or` returns the total effect

Author(s)

Gloria Gheno

References

Gheno Gloria (2015),The causal analysis in the loglinear model

Examples

```
total_effect_mult_or(0.6,0.8,0.5,2,0.7,0.6)
```

<code>total_effect_or</code>	<i>Total effect for loglinear models without the multiplicative interaction</i>
------------------------------	---

Description

This function calculates the total effect using the odds ratio for a loglinear model without the multiplicative interaction and under dummy code parametrization

Usage

```
total_effect_or(x, y, z, w, t)
```

Arguments

x	it is the parameter $\mu^{Y=1}$
y	it is the parameter $\mu^{X=1,Y=1}$
z	it is the parameter $\mu^{Z=1,Y=1}$
w	it is the parameter $\mu_c^{Z=1}$
t	it is the parameter $\mu_c^{X=1,Z=1}$

Value

`total_effect_or` returns the total effect

Author(s)

Gloria Gheno

References

Gheno Gloria (2015),The causal analysis in the loglinear model

Examples

```
total_effect_or(0.6,0.8,0.5,2,0.7)
```
