

Package ‘photosynthesis’

August 15, 2023

Version 2.1.4

Date 2023-08-15

Title Tools for Plant Ecophysiology & Modeling

Depends R (>= 4.0.0), ggplot2 (>= 3.4.0), minpack.lm (>= 1.2-1), units (>= 0.6.6)

Imports checkmate (>= 2.0.0), crayon (>= 1.3.4), dplyr (>= 0.8.5), furr (>= 0.1.0), glue (>= 1.4.0), graphics (>= 4.0.0), grDevices (>= 4.0.0), gunit (>= 1.0.2), lifecycle (>= 1.0.0), magrittr (>= 1.5.0), methods (>= 3.5.0), nlme (>= 3.1-147), progress (>= 1.2.0), purrr (>= 0.3.3), readr (>= 2.0.0), rlang (>= 0.4.6), stats (>= 4.0.0), stringr (>= 1.4.0), tealeaves (>= 1.0.5), utils (>= 4.0.0)

Suggests brms, broom, future, knitr, rmarkdown, testthat, tibble, tidyr, tidyselect

Description Contains modeling and analytical tools for plant ecophysiology. MODELING: Simulate C3 photosynthesis using the Farquhar, von Caemmerer, Berry (1980) <doi:10.1007/BF00386231> model as described in Buckley and Diaz-Espejo (2015) <doi:10.1111/pce.12459>. It uses units to ensure that parameters are properly specified and transformed before calculations. Temperature response functions get automatically “baked” into all parameters based on leaf temperature following Bernacchi et al. (2002) <doi:10.1104/pp.008250>. The package includes boundary layer, cuticular, stomatal, and mesophyll conductances to CO₂, which each can vary on the upper and lower portions of the leaf. Use straightforward functions to simulate photosynthesis over environmental gradients such as Photosynthetic Photon Flux Density (PPFD) and leaf temperature, or over trait gradients such as CO₂ conductance or photochemistry. ANALYTICAL TOOLS: Fit AC_i (Farquhar et al. (1980) <doi:10.1007/BF00386231>) and AQ curves (Marshall & Biscoe (1980) <doi:10.1093/jxb/31.1.29>), temperature responses (Heskel et al. (2016) <doi:10.1073/pnas.1520282113>; Kruse et al. (2008) <doi:10.1111/j.1365-3040.2008.01809.x>, Medlyn et al. (2002) <doi:10.1046/j.1365-3040.2002.00891.x>, Hobbs et al. (2013) <doi:10.1021/cb4005029>), respiration in the light (Kok (1956) <doi:10.1016/0006-3002(56)90003-8>, Walker & Ort (2015) <doi:10.1111/pce.12562>),

Yin et al. (2009) <[doi:10.1111/j.1365-3040.2009.01934.x](https://doi.org/10.1111/j.1365-3040.2009.01934.x)>, Yin et al. (2011) <[doi:10.1093/jxb/err038](https://doi.org/10.1093/jxb/err038)>), mesophyll conductance (Harley et al. (1992) <[doi:10.1104/pp.98.4.1429](https://doi.org/10.1104/pp.98.4.1429)>), pressure-volume curves (Koide et al. (2000) <[doi:10.1007/978-94-009-2221-1_9](https://doi.org/10.1007/978-94-009-2221-1_9)>, Sack et al. (2003) <[doi:10.1046/j.0016-8025.2003.01058.x](https://doi.org/10.1046/j.0016-8025.2003.01058.x)>, Tyree et al. (1972) <[doi:10.1093/jxb/23.1.267](https://doi.org/10.1093/jxb/23.1.267)>), hydraulic vulnerability curves (Ogle et al. (2009) <[doi:10.1111/j.1469-8137.2008.02760.x](https://doi.org/10.1111/j.1469-8137.2008.02760.x)>, Pammenter et al. (1998) <[doi:10.1093/treephys/18.8-9.589](https://doi.org/10.1093/treephys/18.8-9.589)>), and tools for running sensitivity analyses particularly for variables with uncertainty (e.g. `g_mc()`, `gamma_star()`, `R_d()`).

photosynthesis-package

photosynthesis *package*

Description

Tools for Plant Ecophysiology & Modeling

Details

See the README on [GitHub](#)

analyze_sensitivity *Running 2-parameter sensitivity analyses*

Description

Running 2-parameter sensitivity analyses

Usage

```
analyze_sensitivity(  
  data,  
  funct,  
  test1 = NA,  
  values1,  
  test2 = NA,  
  values2,  
  element_out = 1,  
  ...  
)
```

Arguments

data	Dataframe
funct	Function to use - do not use parentheses
test1	Input parameter to vary and test
values1	Values of test1 to use
test2	Input parameter to vary and test
values2	Values of test2 to use
element_out	List element to compile
...	Additional arguments required for the function

Value

analyze_sensitivity runs a 2-parameter sensitivity analysis. Note that any parameter value combinations that break the input function WILL break this function. For 1-parameter sensitivity analysis, use test1 only.

Examples

```
# Read in your data  
# Note that this data is coming from data supplied by the package  
# hence the complicated argument in read.csv()  
# This dataset is a CO2 by light response curve for a single sunflower  
data <- read.csv(system.file("extdata", "A-Ci-Q_data_1.csv",  
  package = "photosynthesis")
```

```

))

# Define a grouping factor based on light intensity to split the ACi
# curves
data$Q_2 <- as.factor((round(data$Qin, digits = 0)))

# Convert leaf temperature to K
data$T_leaf <- data$Tleaf + 273.15

# Run a sensitivity analysis on gamma_star and mesophyll conductance
# at 25 Celsius for one individual curve
# pars <- analyze_sensitivity(
#   data = data[data$Q_2 == 1500, ],
#   funct = fit_aci_response,
#   varnames = list(
#     A_net = "A",
#     T_leaf = "T_leaf",
#     C_i = "Ci",
#     PPFD = "Qin"
#   ),
#   useg_mct = TRUE,
#   test1 = "gamma_star25",
#   element_out = 1,
#   test2 = "g_mc25",
#   fitTPU = TRUE,
#   Ea_gamma_star = 0,
#   Ea_g_mc = 0,
#   values1 = seq(
#     from = 20,
#     to = 40,
#     by = 2
#   ),
#   values2 = seq(
#     from = 0.5,
#     to = 2,
#     by = 0.1
#   )
# )

# Graph V_cmax
# ggplot(pars, aes(x = gamma_star25, y = g_mc25, z = V_cmax)) +
#   geom_tile(aes(fill = V_cmax)) +
#   labs(
#     x = expression(Gamma * "[25] ~ "(" * mu * mol ~ mol^
#     {
#       -1
#     } * ")"),
#     y = expression(g[m][25] ~ "(" * mu * mol ~ m^{
#     -2
#     } ~ s^{
#     -1
#     } ~ Pa^
#     {

```

```

#           -1
#         } * ")")

aq_response

Non-rectangular hyperbolic model of light responses

Description

[Deprecated]

Please use `marshall_biscoe_1980()`.

Usage

```
aq_response(k_sat, phi_J, Q_abs, theta_J)
```

Arguments

<code>k_sat</code>	Light saturated rate of process <code>k</code>
<code>phi_J</code>	Quantum efficiency of process <code>k</code>
<code>Q_abs</code>	Absorbed light intensity ($\mu\text{mol m}^{-2} \text{s}^{-1}$)
<code>theta_J</code>	Curvature of the light response

Value

`aq_response` is used to describe the response of a process to absorbed light intensity. Assumes that input is absorbed light. Note that if absorbed light is not used, then the meaning of `phi_J` becomes unclear. This function is designed to be used with `fit_aq_response`, however it could easily be fed into a different fitting approach (e.g. Bayesian approaches). Originally from Marshall et al. 1980.

References

Marshall B, Biscoe P. 1980. A model for C3 leaves describing the dependence of net photosynthesis on irradiance. *J Ex Bot* 31:29-39

A_supply CO2 supply and demand function (mol / m² s)

Description

This function is not intended to be called by users directly.

Usage

A_supply(C_chl, pars, unitless = FALSE, use_legacy_version = FALSE)

A_demand(C_chl, pars, unitless = FALSE)

Arguments

C_chl Chloroplastic CO2 concentration in Pa of class units
pars Concatenated parameters (leaf_par, enviro_par, and constants)
unitless Logical. Should units be set? The function is faster when FALSE, but input must be in correct units or else results will be incorrect without any warning.
use_legacy_version Logical. Should legacy model (<2.1.0) be used? See **NEWS** for further information. Default is FALSE.

Details

Supply function:

$$A = g_{tc}(C_{air} - C_{chl})$$

Demand function:

$$A = (1 - \Gamma^* / C_{chl})\min(W_{carbox}, W_{regen}, W_{tpu}) - R_d$$

<i>Symbol</i>	<i>R</i>	<i>Description</i>	<i>Units</i>	<i>Default</i>
<i>A</i>	A	photosynthetic rate	μmol CO2 / (m ² s)	calculated
<i>g_{tc}</i>	g_tc	total conductance to CO2	μmol CO2 / (m ² s Pa)	calculated
<i>C_{air}</i>	C_air	atmospheric CO2 concentration	Pa	41
<i>C_{chl}</i>	C_chl	chloroplastic CO2 concentration	Pa	calculated
<i>R_d</i>	R_d	nonphotorespiratory CO2 release	μmol CO2 / (m ² s)	2
<i>Γ*</i>	gamma_star	chloroplastic CO2 compensation point	Pa	3.743

Value

Value in mol / (m² s) of class units

Examples

```

bake_par = make_bakepar()
constants = make_constants(use_tealeaves = FALSE)
enviro_par = make_enviropar(use_tealeaves = FALSE)
leaf_par = make_leafpar(use_tealeaves = FALSE)
leaf_par = bake(leaf_par, enviro_par, bake_par, constants)
# Or bake with piping (need library(magrittr))
# leaf_par %<>% bake(enviro_par, bake_par, constants)
enviro_par$T_air = leaf_par$T_leaf

pars = c(leaf_par, enviro_par, constants)
C_chl = set_units(350, umol/mol)

A_supply(C_chl, pars)

A_demand(C_chl, pars)

```

bake

Leaf parameter temperature responses

Description

'bake' leaf parameters using temperature response functions

Usage

```
bake(leaf_par, enviro_par, bake_par, constants, assert_units = TRUE)
```

```
temp_resp1(par25, E_a, R, T_leaf, T_ref, unitless)
```

```
temp_resp2(par25, D_s, E_a, E_d, R, T_leaf, T_ref, unitless)
```

Arguments

leaf_par	A list of leaf parameters inheriting class leaf_par. This can be generated using the make_leafpar function.
enviro_par	A list of environmental parameters inheriting class enviro_par. This can be generated using the make_enviropar function.
bake_par	A list of temperature response parameters inheriting class bake_par. This can be generated using the make_bakepar function.
constants	A list of physical constants inheriting class constants. This can be generated using the make_constants function.
assert_units	Logical. Should parameter units be checked? The function is faster when FALSE, but input must be in correct units or else results will be incorrect without any warning.
par25	Parameter value at 25 °C of class units.

E_a	Empirical temperature response value in J/mol of class units.
R	Ideal gas constant in J / (mol K) of class units. See make_constants() .
T_leaf	Leaf temperature in K of class units. Will be converted to °C.
T_ref	Reference temperature in K of class units.
unitless	Logical. Should units be set? The function is faster when FALSE, but input must be in correct units or else results will be incorrect without any warning.
D_s	Empirical temperature response value in J / (mol K) of class units.
E_d	Empirical temperature response value in J/mol of class units.

Details

Several leaf parameters ([leaf_par\(\)](#)) are temperature sensitive. Temperature-sensitive parameters are input at a reference temperature of 25 °C. These parameters are provided as `par_name25` and then "baked" using the appropriate temperature response function and parameters in [bake_par\(\)](#). The "baked" parameter will have the name without "25" appended (`par_name`). E.g. `V_cmax25` becomes `V_cmax`.

Temperature response functions following Buckley and Diaz-Espejo (2015)

Temperature response function 1 (`temp_response1`):

$$\text{par}(T_{\text{leaf}}) = \text{par}_{25} \exp(E_a / (RT_{\text{ref}})(T_{\text{leaf}} - 25) / (T_{\text{leaf}} + 273.15))$$

T_{ref} is the reference temperature in K

T_{leaf} is the leaf temperature in °C

Temperature response function 2 (`temp_response2`) is the above equation multiplied by:

$$(1 + \exp((D_s/R - E_d/(RT_{\text{ref}})))) / (1 + \exp((D_s/R) - (E_d/(R(T_{\text{leaf}} + 273.15)))))$$

Function 1 increases exponentially with temperature; Function 2 peaks a particular temperature.

Value

Constructor function for baked class. This will also inherit class [leaf_par\(\)](#) and [list\(\)](#). This function ensures that temperature is "baked in" to leaf parameter calculations `T_leaf` using temperature response functions detailed below.

References

Buckley TN, Diaz-Espejo A. 2015. Partitioning changes in photosynthetic rate into contributions from different variables. *Plant, Cell and Environment* 38: 1200-1211.

Examples

```

bake_par = make_bakepar()
constants = make_constants(use_tealeaves = FALSE)
enviro_par = make_enviropar(use_tealeaves = FALSE)
leaf_par = make_leafpar(
  replace = list(T_leaf = set_units(293.15, K)),
  use_tealeaves = FALSE
)
baked_leafpar = bake(leaf_par, enviro_par, bake_par, constants)

baked_leafpar$V_cmax25
baked_leafpar$V_cmax

```

baked-class	<i>S3 class baked</i>
-------------	-----------------------

Description

See [bake\(\)](#)

bake_par	<i>S3 class bake_par</i>
----------	--------------------------

Description

S3 class bake_par

Usage

```
bake_par(.x)
```

Arguments

.x A list to be constructed into **bake_par**.

Value

Constructor function for bake_par class. This function ensures that leaf temperature gets properly "baked" into leaf parameters.

calculated-parameters *Get default functions for calculated parameters in [photosynthesis](#)*

Description

Get default functions for calculated parameters in [photosynthesis](#)

Usage

```
get_f_parameter(.f_name)
```

Arguments

.f_name	character string of function
---------	------------------------------

calculate_jmax *Inverse non-rectangular hyperbola for J_max calculation*

Description

Inverse non-rectangular hyperbola for J_max calculation

Usage

```
calculate_jmax(PPFD, alpha, J, theta_J)
```

```
calculate_j(PPFD, alpha, J_max, theta_J)
```

Arguments

PPFD	light intensity in $\mu\text{mol m}^{-2} \text{s}^{-1}$
alpha	initial slope of the light response
J	electron transport rate in $\mu\text{mol m}^{-2} \text{s}^{-1}$
theta_J	curvature of the light response
J_max	maximum rate of electron transport in $\mu\text{mol m}^{-2} \text{s}^{-1}$

Value

calculate_jmax calculates J_max given PPFD and J. It is necessary for the electron transport component of the fit_aci_response function.

calculate_j provides a model of the light response of J. It is necessary for fitting the electron transport component of the photosynthetic CO₂ response curves in fit_aci_response.

CO2_conductance	<i>Conductance to CO2 (mol / m² / s)</i>
-----------------	---

Description

Conductance to CO2 (mol / m² / s)

- `g_tc`: total conductance to CO2
- `g_uc`: cuticular conductance to CO2
- `g_bc`: boundary layer conductance to CO2
- `g_mc`: mesophyll conductance to CO2
- `g_sc`: stomatal conductance to CO2

Usage

```
.get_gtc(pars, unitless, use_legacy_version)
.get_guc(pars, surface, unitless)
.get_gbc(pars, surface, unitless, use_legacy_version)
.get_gmc(pars, surface, unitless)
.get_gsc(pars, surface, unitless)
```

Arguments

<code>pars</code>	Concatenated parameters (leaf_par, enviro_par, and constants)
<code>unitless</code>	Logical. Should units be set? The function is faster when FALSE, but input must be in correct units or else results will be incorrect without any warning.
<code>use_legacy_version</code>	Logical. Should legacy model (<2.1.0) be used? See NEWS for further information. Default is FALSE.
<code>surface</code>	Leaf surface (lower or upper)

Details

Default conductance model

The conductance model described in this section is used by default unless additional anatomical parameters described in the next section are provided.

Total conductance to CO2 is the sum of parallel conductances on the lower ($g_{c,lower}$) and upper ($g_{c,upper}$) leaf portions:

$$g_{c,\text{total}} = g_{c,\text{lower}} + g_{c,\text{upper}}$$

Each partial conductance consists of two parallel conductances, the cuticular conductance ($g_{u,c}$) and the in-series conductances through mesophyll ($g_{m,c}$), stomata ($g_{s,c}$), and boundary layer ($g_{b,c}$). To simplify the formula, I use substitute resistance where $r_x = 1/g_x$. For surface i :

$$g_{c,i} = g_{u,i} + (1/(r_{m,i} + r_{s,i} + r_{b,i}))$$

The cuticular, stomatal, and mesophyll conductances can be the same or different for upper and lower. The partitioning factors (k_x) divide the conductance between surfaces while keeping the total conductance constant:

$$g_{x,\text{lower}} = g_x(1/(1 + k_x))$$

$$g_{x,\text{upper}} = g_x(k_x/(1 + k_x))$$

$$g_x = g_{x,\text{lower}} + g_{x,\text{upper}}$$

How the partitioning factors work:

k_x	description
0	all conductance on lower surface/portion
0.5	2/3 conductance on lower surface
1	conductance evenly divided between surfaces/portions
2	2/3 conductance on upper surface
Inf	all conductance on upper surface/portion

The boundary layer conductances for each are calculated on the basis of mass and heat transfer (see [.get_gbc\(\)](#)).

Symbol	R	Description	Units	Default
g_{mc}	g_mc	mesophyll conductance to CO2 (T_leaf)	mol / m ² / s	calculated
g_{sc}	g_sc	stomatal conductance to CO2	mol / m ² / s	0.4
g_{uc}	g_uc	cuticular conductance to CO2	mol / m ² / s	0.01
k_{mc}	k_mc	partition of g_{mc} to lower mesophyll	none	1
k_{sc}	k_sc	partition of g_{sc} to lower surface	none	1
k_{uc}	k_uc	partition of g_{uc} to lower surface	none	1

New conductance model

The conductance model described in this section is implemented in **photosynthesis** ($\geq 2.1.0$) if parameters to calculate the internal airspace and liquid-phase conductances ($A_{\text{mes_A}}$, g_{liqc}) are provided. These parameters are 1) the effective path lengths through the lower and upper leaf internal airspaces (delta_ias_lower , delta_ias_upper) and 2) the mesophyll area per leaf area ($A_{\text{mes_A}}$) and liquid-phase conductance per mesophyll cell area (g_{liqc}).

Two parallel diffusion pathways, one from each leaf surface, converge to a single CO2 concentration

at the mesophyll cell boundary. We use a single liquid-phase resistance to represent the combined cell wall, plasmalemma, and chloroplast resistances. The gas-phase resistance through boundary layer, cuticle/stomata, and internal airspace is $r_{\text{gas},c}$; the liquid-phase intracellular resistance is $r_{i,c}$.

$$r_{\text{total},c} = r_{\text{gas},c} + r_{i,c}$$

The gas-phase resistance occurs through two parallel pathways, which we refer to as the 'lower' and 'upper' pathways because horizontally oriented leaves often have different anatomical properties on each surface. The gas-phase resistance through pathway $i \in \{\text{lower}, \text{upper}\}$ is:

$$r_{\text{gas},c,i} = r_{b,c,i} + r_{u+s,c,i} + r_{\text{ias},c,i}$$

The subscripts b , $u+s$, and ias denote boundary layer, cuticular + stomatal, and internal airspace, respectively. The subscript c indicates we are considering the conductance to CO₂ rather than another molecular species.

Cuticular and stomatal conductances (1 / resistance) are parallel, so:

$$1/r_{u+s,c,i} = g_{u+s,c,i} = g_{u,c,i} + g_{s,c,i}$$

Substituting the above expression into the equation for $r_{\text{gas},c,i}$:

$$r_{\text{gas},c,i} = r_{b,c,i} + 1/(g_{u,c,i} + g_{s,c,i}) + r_{\text{ias},c,i}$$

The total gas-phase resistance is the inverse of the sum of the parallel lower and upper conductances:

$$1/r_{\text{gas},c} = g_{\text{gas},c,\text{lower}} + g_{\text{gas},c,\text{upper}}$$

The cuticular, stomatal, and mesophyll conductances can be the same or different for upper and lower. The partitioning factors k_u and k_s divide the total cuticular and stomatal conductances, respectively, between surfaces while keeping the total conductance constant:

$$g_{x,\text{lower}} = g_x(1/(1 + k_x))$$

$$g_{x,\text{upper}} = g_x(k_x/(1 + k_x))$$

$$g_x = g_{x,\text{lower}} + g_{x,\text{upper}}$$

How the partitioning factors work:

k_x	description
0	all conductance on lower surface/portion
0.5	2/3 conductance on lower surface
1	conductance evenly divided between surfaces/portions
2	2/3 conductance on upper surface
Inf	all conductance on upper surface/portion

The internal airspace conductance is the diffusivity of CO₂ at a given temperature and pressure

divided by the effective path length:

$$g_{ias,c,lower} = D_c / \delta_{ias,lower}$$

$$g_{ias,c,upper} = D_c / \delta_{ias,upper}$$

`g_iasc_lower` and `g_iasc_upper` are calculated in the `bake` function. See `tealeaves::get_Dx()` for calculating `D_c`.

The liquid-phase intracellular resistance is given by:

$$1/r_{i,c} = g_{i,c} = g_{liq,c} A_{mes} / A$$

`gliq,c` is temperature sensitive. See `bake()`.

The boundary layer conductances for each are calculated on the basis of mass and heat transfer (see `.get_gbc()`).

compile_data

Compiling outputs from lists

Description

Compiling outputs from lists

Usage

```
compile_data(data, output_type = "list", list_element)
```

Arguments

<code>data</code>	List of elements
<code>output_type</code>	Type of desired output. For graphs or models, use "list", for parameters, use "dataframe".
<code>list_element</code>	Which elements of the sublists do you wish to compile?

Value

`compile_data` converts the outputs of `fit_many` into a form more readily usable for analysis. Can be used to create dataframe of all fitted parameters, a list of model outputs, a list of graphs for plotting. This function is NOT restricted to compiling outputs from `plantecophystools` but could be used to compile elements from ANY list of lists.

Examples

```
# Read in your data
# Note that this data is coming from data supplied by the package
# hence the complicated argument in read.csv()
# This dataset is a CO2 by light response curve for a single sunflower
data <- read.csv(system.file("extdata", "A_Ci_Q_data_1.csv",
  package = "photosynthesis"
))

# Define a grouping factor based on light intensity to split the ACi
# curves
data$Q_2 <- as.factor((round(data$Qin, digits = 0)))

# Convert leaf temperature to K
data$T_leaf <- data$Tleaf + 273.15

# Fit many curves
fits <- fit_many(
  data = data,
  varnames = list(

plot(fits_graphs[[1]])
```

compute_sensitivity *Computing measures of sensitivity*

Description

Computing measures of sensitivity

Usage

```
compute_sensitivity(
```

```

    data,
    varnames = list(Par = "Par", test1 = "test1", test2 = "test2"),
    test1_ref,
    test2_ref
  )

```

Arguments

data	Dataframe with output from sensitivity_analysis()
varnames	Variable names
test1_ref	Reference value for parameter
test2_ref	Reference value for parameter

Value

compute_sensitivity calculates two sets of sensitivity measures: parameter effect (Bauerle et al., 2014), and control coefficient (Capaldo & Pandis, 1997). This function is useful in determining how much a given input (assumed or otherwise) can affect the model output and conclusions. Particularly useful if a given parameter is unknown during a fitting or modeling process.

# # Note that in this case a missing point appears due to an infinity

```

 constants

S3 class constants

Description

S3 class constants

Usage

```
constants(.x, use_tealeaves)
```

Arguments

`.x` A list to be constructed into **constants**.

`use_tealeaves` Logical. Should leaf energy balance be used to calculate leaf temperature (`T_leaf`)? If TRUE, `tleaf()` calculates `T_leaf`. If FALSE, user-defined `T_leaf` is used. Additional parameters and constants are required, see `make_parameters()`.

Value

Constructor function for constants class. This function ensures that physical constant inputs are properly formatted.

enviro_par	<i>S3 class enviro_par</i>
------------	----------------------------

Description

S3 class enviro_par

Usage

```
enviro_par(.x, use_tealeaves)
```

Arguments

`.x` A list to be constructed into **enviro_par**.

`use_tealeaves` Logical. Should leaf energy balance be used to calculate leaf temperature (`T_leaf`)? If TRUE, `tleaf()` calculates `T_leaf`. If FALSE, user-defined `T_leaf` is used. Additional parameters and constants are required, see `make_parameters()`.

Value

Constructor function for enviro_par class. This function ensures that environmental parameter inputs are properly formatted.

fit_aci_response	<i>Fitting ACi curves</i>
------------------	---------------------------

Description

Fitting ACi curves

Usage

```
fit_aci_response(
  data,
  varnames = list(A_net = "A_net", T_leaf = "T_leaf", C_i = "C_i", PPF = "PPFD", g_mc =
    "g_mc"),
  P = 100,
  fitTPU = TRUE,
  alpha_g = 0,
  R_d_meas = NULL,
  useR_d = FALSE,
  useg_mc = FALSE,
  useg_mct = FALSE,
  usegamma_star = FALSE,
  useK_M = FALSE,
  useK_C_K_0 = FALSE,
  alpha = 0.24,
  theta_J = 0.85,
  gamma_star25 = 42.75,
  Ea_gamma_star = 37830,
  K_M25 = 718.4,
  Ea_K_M = 65508.28,
  g_mc25 = 0.08701,
  Ea_g_mc = 0,
  K_C25 = NULL,
  Ea_K_C = NULL,
  K_025 = NULL,
  Ea_K_0 = NULL,
  Oconc = 21,
  gamma_star_set = NULL,
  K_M_set = NULL,
  ...
)
```

Arguments

data	Dataframe for A-Ci curve fitting
varnames	List of variable names. varnames = list(A_net = "A_net", T_leaf = "T_leaf", C_i = "C_i", PPF = "PPFD", g_mc = "g_mc"), where A_net is net CO2 assimilation, T_leaf is leaf temperature in Celsius, C_i is intercellular CO2 concentra-

tion in $\mu\text{mol}/\text{mol}$, PPFD is incident irradiance in $\mu\text{mol m}^{-2} \text{s}^{-1}$ (note that it is ASSUMED to be absorbed irradiance, so be sure to adjust according to light absorbance and PSI/PSII partitioning accordingly OR interpret the resultant values of J and J_{max} with caution), g_{mc} is mesophyll conductance to CO_2 in $\text{mol m}^{-2} \text{s}^{-1} \text{Pa}^{-1}$.

P	Atmospheric pressure in kPa
fitTPU	Should triose phosphate utilization (V_{TPU}) be fit?
alpha_g	Fraction of respiratory glycolate carbon that is not returned to the chloroplast (von Caemmerer, 2000). If ACi curves show high- CO_2 decline, then this value should be > 0 .
R_d_meas	Measured value of respiratory CO_2 efflux in $\mu\text{mol m}^{-2} \text{s}^{-1}$. Input value should be positive to work as expected with the equations.
useR_d	Use a measured value of R_d ? Set to TRUE if using R_d_{meas} .
useg_mc	Use mesophyll conductance? Set to TRUE if specifying g_{mc} in varnames above.
useg_mct	Use mesophyll conductance temperature response? Set to TRUE if using a temperature response of mesophyll conductance.
usegamma_star	Specify γ_{star} value? If FALSE, uses a temperature response function with <i>Nicotiana tabacum</i> defaults from Bernacchi et al. 2001.
useK_M	Specify K_M ? If FALSE, uses an Arrhenius temperature response function with <i>Nicotiana tabacum</i> defaults from Bernacchi et al. 2001.
useK_C_K_O	Use individual carboxylation/oxygenation constants for rubisco? If TRUE, need to specify values at 25C and activation energy for the Arrhenius temperature response function.
alpha	Quantum yield of CO_2 assimilation
theta_J	Curvature of the photosynthetic light response curve
gamma_star25	γ_{star} at 25C in $\mu\text{mol mol}^{-1}$
Ea_gamma_star	Activation energy of γ_{star} in J mol^{-1}
K_M25	Michaelis-Menten constant for rubisco at 25C
Ea_K_M	Activation energy for K_M in J mol^{-1}
g_mc25	Mesophyll conductance at 25C in $\text{mol m}^{-2} \text{s}^{-1}$
Ea_g_mc	Activation energy of g_{mc} in J mol^{-1}
K_C25	Michaelis-Menten constant for rubisco carboxylation at 25C
Ea_K_C	Activation energy for K_C in J mol^{-1}
K_O25	Michaelis-Menten constant for rubisco oxygenation at 25C
Ea_K_O	Activation energy for K_O in J mol^{-1}
Oconc	O_2 concentration in %. Used with P to calculate intracellular O_2 when using $K_C_K_O$
gamma_star_set	Value of γ_{star} to use (in ppm) if usegamma_star = TRUE
K_M_set	Value of K_M to use if useK_M = TRUE
...	Other arguments to pass on

Value

fit_aci_response fits ACi curves using an approach similar to Gu et al. 2010. Iterates all possible C_i transition points and checks for inadmissible curve fits. If no curves are admissible (either due to poor data or poor assumed parameters), the output will include a dataframe of NA values. Default parameters are all from Bernacchi et al. 2001, 2002.

fit_aq_response

Fitting light responses of net CO2 assimilation

Description

[Deprecated]

Please use `fit_aq_response2()`.

Usage

```
fit_aq_response(
  data,
  varnames = list(A_net = "A_net", PPF = "PPFD"),
  usealpha_Q = FALSE,
  alpha_Q = 0.84,
  title = NULL
)
```

Arguments

data	Dataframe containing CO2 assimilation light response
varnames	Variable names where varnames = list(A_net = "A_net", PPF = "PPFD"). A_net is net CO2 assimilation in $\mu\text{mol m}^{-2} \text{s}^{-1}$, PPF is incident irradiance. PPF can be corrected for light absorbance by using usealpha_Q and setting alpha_Q.
usealpha_Q	Correct light intensity for absorbance? Default is FALSE.
alpha_Q	Absorbance of incident light. Default value is 0.84.
title	Title for graph

Value

fit_aq_response fits the light response of net CO2 assimilation. Output is a dataframe containing light saturated net CO2 assimilation, quantum yield of CO2 assimilation (ϕ_J), curvature of the light response (θ_J), respiration (Rd), light compensation point (LCP), and residual sum of squares (resid_SS). Note that Rd fitted in this way is essentially the same as the Kok method, and represents a respiration value in the light that may not be accurate. Rd output should thus be interpreted more as a residual parameter to ensure an accurate fit of the light response parameters. Model originally from Marshall & Biscoe 1980.

References

    list_element = 2
  )

```

fit_aq_response2

Fit photosynthetic light-response curves

Description

We recommend using `fit_photosynthesis()` with argument `.photo_fun = "aq_response"` rather than calling this function directly.

Usage

```

fit_aq_response2(
  .data,
  .model = "default",
  .method = "ls",
  usealpha_Q = FALSE,
  alpha_Q = 0.84,
  quiet = FALSE,
  brm_options = NULL
)

```

Arguments

<code>.data</code>	A data frame containing plant ecophysiological data. See <code>required_variables()</code> for the variables required for each model.
<code>.model</code>	A character string of model name to use. See <code>get_all_models()</code> .
<code>.method</code>	A character string of the statistical method to use: 'ls' for least-squares and 'brms' for Bayesian model using <code>brms::brm()</code> . Default is 'ls'.
<code>usealpha_Q</code>	Flag. Should light intensity be multiplied by <code>alpha_Q</code> before fitting? Default is FALSE (i.e. assume that '.Q' is absorbed light).
<code>alpha_Q</code>	Number. Absorbance of incident light. Default value is 0.84. Ignored if <code>usealpha_Q = FALSE</code> .
<code>quiet</code>	Flag. Should messages be suppressed? Default is FALSE.
<code>brm_options</code>	A list of options passed to <code>brms::brm()</code> if <code>.method = "brms"</code> . Default is NULL.

Value

- If `.method = 'ls'`: an `stats::nls()` object.
- If `.method = 'brms'`: a `brms::brmsfit()` object.

Note

Rd fitted in this way is essentially the same as the Kok (1956) method, and represents a respiration value in the light that may not be accurate. Rd output should thus be interpreted more as a residual parameter to ensure an accurate fit of the light response parameters. Model originally from Marshall & Biscoe (1980).

  split(~ group) |>
  map(fit_photosynthesis, .photo_fun = "aq_response", .vars = list(.A = A, .Q = Qabs))
```

 fit_gs_model

Fitting stomatal conductance models

Description

Fitting stomatal conductance models

Usage

```
fit_gs_model(
  data,
  varnames = list(A_net = "A_net", C_air = "C_air", g_sw = "g_sw", RH = "RH", VPD =
    "VPD"),
  model = c("BallBerry", "Leuning", "Medlyn_partial", "Medlyn_full"),
  D0 = 3,
  ...
)
```

Arguments

data	Dataframe
varnames	Variable names For the Ball-Berry model: varnames = list(A_net = "A_net", C_air = "C_air", g_sw = "g_sw", RH = "RH") where A_net is net CO ₂ assimilation, C_air is CO ₂ concentration at the leaf surface in $\mu\text{mol mol}^{-1}$, g_sw is stomatal conductance to H ₂ O, and RH is relative humidity as a proportion. For the Leuning model: varnames = list(A_net = "A_net", C_air = "C_air", g_sw = "g_sw", VPD = "VPD") where A_net is net CO ₂ assimilation, C_air is CO ₂ concentration at the leaf surface in $\mu\text{mol mol}^{-1}$, g_sw is stomatal conductance to H ₂ O, and VPD is leaf to air vapor pressure deficit in kPa. For the Medlyn et al. 2011 models: varnames = list(A_net = "A_net", C_air = "C_air", g_sw = "g_sw", VPD = "VPD") where A_net is net CO ₂ assimilation, C_air is CO ₂ concentration at the leaf surface in $\mu\text{mol mol}^{-1}$, g_sw is stomatal conductance to H ₂ O, and VPD is leaf to air vapor pressure deficit in kPa.
model	Which model(s) to fit? Defaults to all models. Available options are "Ball-Berry", "Leuning", "Medlyn_partial", and "Medlyn_full", from Ball et al. (1987), Leuning (1995), and Medlyn et al. (2011).
D0	Vapor pressure sensitivity of stomata (Leuning 1995)
...	Arguments to pass on to the nlsLM() function for the Medlyn models.

Value

fit_gs_model fits one or more stomatal conductance models to the data. The top level of the output list is named after the fitted model, while the second level contains the Model, Parameters, and Graph, in that order.

fit_g_mc_variableJ *Fitting mesophyll conductance with the variable J method*

Description

Fitting mesophyll conductance with the variable J method

Usage

```

fit_g_mc_variableJ(
  data,
  varnames = list(A_net = "A_net", J_etr = "J_etr", C_i = "C_i", PPF = "PPFD", phi_PSII
    = "phi_PSII"),
  usealpha_Q = FALSE,
  alpha_Q = 0.84,
  beta_Q = 0.5,
  gamma_star,
  R_d,
  P = 100
)

```

Arguments

data	Dataframe
varnames	Variable names to fit g_mc. varnames = list(A_net = "A_net", J_etr = "J_etr", C_i = "C_i", PPF = "PPFD", phi_PSII = "phi_PSII"), where A_net is net CO ₂ assimilation in $\mu\text{mol m}^{-2} \text{s}^{-1}$, J_etr is linear electron transport flux in $\mu\text{mol m}^{-2} \text{s}^{-1}$, C_i is intercellular CO ₂ concentration in $\mu\text{mol mol}^{-1}$, PPF is incident irradiance in $\mu\text{mol m}^{-2} \text{s}^{-1}$, phi_PSII is the operating efficiency of photosystem II.
usealpha_Q	Recalculate electron transport with new absorbance value?

alpha_Q	Absorbance of photosynthetically active radiation
beta_Q	Partitioning of absorbed light energy between PSI and PSII
gamma_star	Photorespiratory CO ₂ compensation point in $\mu\text{mol mol}^{-1}$
R_d	Respiration rate in $\mu\text{mol m}^{-2} \text{s}^{-1}$
P	Atmospheric pressure in kPa

Value

fit_g_mc_variableJ fits mesophyll conductance according to Harley et al. 1992. It also tests the reliability of the calculation and calculates a mean with only reliable values. Note that the output is in units of $\mu\text{mol m}^{-2} \text{s}^{-1} \text{Pa}^{-1}$.

fit_hydra_vuln_curve *Fitting hydraulic vulnerability curves*

Description

Fitting hydraulic vulnerability curves

Usage

```

fit_hydra_vuln_curve(
  data,
  varnames = list(psi = "psi", PLC = "PLC"),
  start_weibull = list(a = 2, b = 2),
  title = NULL
)

```

Arguments

data	Dataframe
varnames	List of variable names. varnames = list(psi = "psi", PLC = "PLC") where psi is water potential in MPa, and PLC is percent loss conductivity.
start_weibull	starting values for the nls fitting routine for the Weibull curve
title	Title for the output graph

Value

fit_hydra_vuln_curve fits a sigmoidal function (Pammenter & Van der Willigen, 1998) linearized according to Ogle et al. (2009). Output is a list containing the sigmoidal model in element 1 and Weibull model in element 4, the fit parameters with 95% confidence interval for both models are in element 2, and hydraulic parameters in element 3 (including P25, P50, P88, P95, S50, Pe, Pmax, DSI). Px (25 to 95): water potential at which x% of conductivity is lost. S50: slope at 50% loss of conductivity. Pe: air entry point. Pmax: hydraulic failure threshold. DSI: drought stress interval. Element 5 is a graph showing the fit, P50, Pe, and Pmax.

  list_element = 5
)
```

Description**[Deprecated]**

We are no longer updating this function. Please use generic methods like [map](#) instead. See `vignette("light-response")` for an example.

Usage

```
fit_many(data, funct, group, progress = TRUE, ...)
```

Arguments

data	Dataframe
funct	Function to fit
group	Grouping variables
progress	Flag. Show progress bar?
...	Arguments for the function to fit. Use <code>?functionname</code> to read the help file on available arguments for a given function.

Value

fit_many fits a function across every instance of a grouping variable.

Examples

```
# Read in your data
# Note that this data is coming from data supplied by the package
# hence the complicated argument in read.csv()
# This dataset is a CO2 by light response curve for a single sunflower
data = read.csv(system.file("extdata", "A_Ci_Q_data_1.csv",
  package = "photosynthesis"
))

# Define a grouping factor based on light intensity to split the ACi
# curves
data$Q_2 = as.factor((round(data$Qin, digits = 0)))

# Convert leaf temperature to K
data$T_leaf = data$Tleaf + 273.15

# Fit many curves
fits = fit_many(
  data = data,
  varnames = list(
    A_net = "A",
    T_leaf = "T_leaf",
    C_i = "Ci",
    PPFd = "Qin"
  ),
```

```
    funct = fit_aci_response,
    group = "Q_2"
  )

  # Print the parameters
  # First set of double parentheses selects an individual group value
  # Second set selects an element of the sublist
  fits[[3]][[1]]

  # Print the graph
  fits[[3]][[2]]

  # Compile graphs into a list for plotting
  fits_graphs = compile_data(fits,
    list_element = 2
  )

  # Compile parameters into dataframe for analysis
  fits_pars = compile_data(fits,
    output_type = "dataframe",
    list_element = 1
  )
```

fit_photosynthesis *Fit photosynthetic models with gas-exchange data*

Description

Fit photosynthetic models with gas-exchange data

Usage

```
fit_photosynthesis(
  .data,
  .photo_fun,
  .model = "default",
  .vars = NULL,
  .method = "ls",
  ...,
  quiet = FALSE,
  brm_options = NULL
)
```

Arguments

`.data` A data frame containing plant ecophysiological data. See [required_variables\(\)](#) for the variables required for each model.

.photo_fun	A character string of photosynthesis function to call. One of: aq_response, r_light.
.model	A character string of model name to use. See get_all_models() .
.vars	A list to rename variables in .data. See required_variables() for the accepted variable names.
.method	A character string of the statistical method to use: 'ls' for least-squares and 'brms' for Bayesian model using brms::brm() . Default is 'ls'.
...	Additional arguments passed to specific models. See specific help pages for each type of photosynthetic model: <ul style="list-style-type: none"> • Light-response curves fit_aq_response2() • Light respiration fit_r_light2()
quiet	Flag. Should messages be suppressed? Default is FALSE.
brm_options	A list of options passed to brms::brm() if .method = "brms". Default is NULL.

Value

A fitted model object

- class 'lm' or 'nls' if method = 'ls'
- class 'brmsfit' if method = 'brms'

Note

This function will fit models to data but several methods require post-processing to extract meaningful parameter estimates and confidence intervals. See vignettes for further explanation and examples.

- Light-response curves: [vignette\("light-response", package = "photosynthesis"\)](#)
- Light respiration: [vignette\("light-respiration", package = "photosynthesis"\)](#)

fit_PV_curve	<i>Fitting pressure-volume curves</i>
--------------	---------------------------------------

Description

Fitting pressure-volume curves

Usage

```
fit_PV_curve(
  data,
  varnames = list(psi = "psi", mass = "mass", leaf_mass = "leaf_mass", bag_mass =
    "bag_mass", leaf_area = "leaf_area"),
  title = NULL
)
```

Arguments

<code>data</code>	Dataframe
<code>varnames</code>	Variable names. <code>varnames = list(psi = "psi", mass = "mass", leaf_mass = "leaf_mass", bag_mass = "bag_mass", leaf_area = "leaf_area")</code> where <code>psi</code> is leaf water potential in MPa, <code>mass</code> is the weighed mass of the bag and leaf in g, <code>leaf_mass</code> is the mass of the leaf in g, <code>bag_mass</code> is the mass of the bag in g, and <code>leaf_area</code> is the area of the leaf in cm ² .
<code>title</code>	Graph title

Value

`fit_PV_curve` fits pressure-volume curve data to determine: `SWC`: saturated water content per leaf mass (g H₂O g leaf dry mass⁻¹), `PI_o`: osmotic potential at full turgor (MPa), `psi_TLP`: leaf water potential at turgor loss point (TLP) (MPa), `RWC_TLP`: relative water content at TLP (%), `eps`: modulus of elasticity at full turgor (MPa), `C_FT`: relative capacitance at full turgor (MPa⁻¹), `C_TLP`: relative capacitance at TLP (MPa⁻¹), and `C_FTStar`: absolute capacitance per leaf area (g m⁻² MPa⁻¹). Element 1 of the output list contains the fitted parameters, element 2 contains the water-psi graph, and element 3 contains the 1/psi-100-RWC graph.

```

fit_r_light2	<i>Fit models to estimate light respiration (R_d)</i>
--------------	--

Description

We recommend using `fit_photosynthesis()` with argument `.photo_fun = "r_light"` rather than calling this function directly.

Usage

```
fit_r_light2(
  .data,
  .model = "default",
  .method = "ls",
  Q_lower = NA,
  Q_upper = NA,
  Q_levels = NULL,
  C_upper = NA,
  quiet = FALSE,
  brm_options = NULL
)
```

Arguments

<code>.data</code>	A data frame containing plant ecophysiological data. See <code>required_variables()</code> for the variables required for each model.
<code>.model</code>	A character string of model name to use. See <code>get_all_models()</code> .
<code>.method</code>	A character string of the statistical method to use: 'ls' for least-squares and 'brms' for Bayesian model using <code>brms::brm()</code> . Default is 'ls'.
<code>Q_lower</code>	Lower light intensity limit for estimating R_d using kok_1956 and yin_etal_2011 models.
<code>Q_upper</code>	Upper light intensity limit for estimating R_d using kok_1956 and yin_etal_2011 models
<code>Q_levels</code>	A numeric vector of light intensity levels ($\mu\text{mol} / \text{mol}$) for estimating R_d from the linear region of the A-C curve using the walker_ort_2015 model.
<code>C_upper</code>	Upper C ($\mu\text{mol} / \text{mol}$) limit for estimating R_d from the linear region of the A-C curve using the walker_ort_2015 model.
<code>quiet</code>	Flag. Should messages be suppressed? Default is FALSE.
<code>brm_options</code>	A list of options passed to <code>brms::brm()</code> if <code>.method = "brms"</code> . Default is NULL.

Value

- If `.method = 'ls'`: an `stats::nls()` or `stats::lm()` object.
- If `.method = 'brms'`: a `brms::brmsfit()` object.

Note

Confusingly, R_d typically denotes respiration in the light, but you might see R_{day} or R_{light} .

Models*Kok (1956)*

The kok_1956 model estimates light respiration using the Kok method (Kok, 1956). The Kok method involves looking for a breakpoint in the light response of net CO₂ assimilation at very low light intensities and extrapolating from data above the breakpoint to estimate light respiration as the y-intercept. Rd value should be negative, denoting an efflux of CO₂.

Yin et al. (2011)

The yin_etal_2011 model estimates light respiration according to the Yin *et al.* (2009, 2011) modifications of the Kok method. The modification uses fluorescence data to get a better estimate of light respiration. Rd values should be negative here to denote an efflux of CO₂.

Walker & Ort (2015)

The walker_ort_2015 model estimates light respiration and Γ^* according to Walker & Ort (2015) using a slope- intercept regression method to find the intercept of multiple A-C curves run at multiple light intensities. The method estimates Γ^* and R_d . If estimated R_d is positive this could indicate issues (i.e. leaks) in the gas exchange measurements. Γ^* is in units of $\mu\text{mol} / \text{mol}$ and R_d is in units of $\mu\text{mol m}^{-2} \text{s}^{-1}$ of respiratory flux. If using C_i , the estimated value is technically C_i^* . You need to use C_c to get Γ^* . Also note, however, that the convention in the field is to completely ignore this note.

fit_r_light_kok

Estimating light respiration

Description

[Deprecated]

Please use `fit_r_light2()`.

Usage

```
fit_r_light_kok(
```

```

    data,
    varnames = list(A_net = "A_net", PPFD = "PPFD"),
    PPFD_lower = 40,
    PPFD_upper = 100
)

fit_r_light_WalkerOrt(
  data,
  varnames = list(A_net = "A_net", C_i = "C_i", PPFD = "PPFD"),
  P = 100,
  C_i_threshold = 300
)

fit_r_light_yin(
  data,
  varnames = list(A_net = "A_net", PPFD = "PPFD", phi_PSII = "phi_PSII"),
  PPFD_lower = 40,
  PPFD_upper = 100
)

```

Arguments

data	Dataframe
varnames	List of variable names
PPFD_lower	Lower light intensity limit for estimating Rlight (Kok & Yin)
PPFD_upper	Upper light intensity limit for estimating Rlight (Kok & Yin)
P	Atmospheric pressure in kPa (Walker & Ort, 2015)
C_i_threshold	Threshold C _i (in umol / mol) to cut data to linear region for fitting light respiration and gamma_star (Walker & Ort, 2015)

Value

fit_r_light_kok estimates light respiration using the Kok method (Kok, 1956). The Kok method involves looking for a breakpoint in the light response of net CO₂ assimilation at very low light intensities and extrapolating from data above the breakpoint to estimate light respiration as the y-intercept. r_light value should be negative, denoting an efflux of CO₂.

fit_r_light_WalkerOrt estimates light respiration and GammaStar according to Walk & Ort (2015) using a slope- intercept regression method to find the intercept of multiple AC_i curves run at multiple light intensities. Output GammaStar and respiration should be negative If output respiration is positive this could indicate issues (i.e. leaks) in the gas exchange measurements. GammaStar is output in umol mol⁻¹, and respiration is output in umol m⁻² s⁻¹ of respiratory flux. Output is a list containing the slope intercept regression model, a graph of the fit, and estimates of the coefficients. NOTE: if using C_i, the output value is technically C_istar. You need to use C_c to get GammaStar. Also note, however, that the convention in the field is to completely ignore this note.

fit_r_light_yin estimates light respiration according to the Yin et al. (2009, 2011) modifications of the Kok method. The modification uses fluorescence data to get a better estimate of light respiration. Note that respiration output should be negative here to denote an efflux of CO₂.

fit_t_response

Fitting temperature responses

Description

Fitting temperature responses

Usage

```

fit_t_response(
  data,
  varnames = list(Par = "Par", T_leaf = "T_leaf"),

```

```

model = c("Arrhenius", "Kruse", "Heskel", "Medlyn", "MMRT", "Quadratic", "Topt"),
start = list(a = 1, b = 1, c = 1, dEa = 1, Ea_ref = 1, Par_ref = 1, Ea = 40000, Par25 =
  50, Hd = 2e+05, dS = 650, dCp = 1, dG = 1, dH = 1),
setvar = "none",
hdset = 2e+05,
dSset = 650,
title = NULL,
...
)

```

Arguments

data	Dataframe with temperature response variables
varnames	Variable names, where Par is the parameter of interest, and T_leaf is the leaf temperature in K.
model	Which temperature response model do you want to use? Defaults to all: Arrhenius, Heskel, Kruse, Medlyn, MMRT, Quadratic, and Topt.
start	List of starting parameters for the nls model fits. a, b, and c are needed for the Heskel model, dEa, Ea_ref, and Par_ref are needed for the Kruse model, Ea, Par25, and Hd are all needed for the Medlyn and Topt models while the Medlyn model also requires dS, and dCP, dG, and dH are all for the MMRT model.
setvar	Which variable to set as constant for the Medlyn model? Defaults to "none", while "Hd" and "dS" options are available.
hdset	Which value should Hd be set to when setvar = "Hd"? Specify in J/mol.
dSset	Which value should dS be set to when setvar = "dS"? Specify in J/mol/K.
title	Title of output graphs
...	Further arguments to pass on to the nlsLM() function

Value

fit_t_response fits one or more temperature response models to a dataset, returning a list of lists. The parent list contains the models, while the child list for each model contains the fitted model in element 1, the coefficients in element 2, and a graph in element 3.

```

Description

Farquhar-von Caemmerer-Berry (FvCB) C3 photosynthesis model

Rubisco-limited assimilation rate

RuBP regeneration-limited assimilation rate

TPU-limited assimilation rate

Usage

```
FvCB(C_chl, pars, unitless = FALSE)

W_carbox(C_chl, pars, unitless = FALSE)

W_regen(C_chl, pars, unitless = FALSE)

W_tpu(C_chl, pars, unitless = FALSE)
```

Arguments

C_chl	Chloroplastic CO2 concentration in Pa of class units
pars	Concatenated parameters (leaf_par, enviro_par, and constants)
unitless	Logical. Should units be set? The function is faster when FALSE, but input must be in correct units or else results will be incorrect without any warning.

Details

Equations following Buckley and Diaz-Espejo (2015):

Rubisco-limited assimilation rate:

$$W_{\text{carbox}} = V_{c,\text{max}} C_{\text{chl}} / (C_{\text{chl}} + K_m)$$

where:

$$K_m = K_C(1 + O/K_O)$$

RuBP regeneration-limited assimilation rate:

$$W_{\text{regen}} = J C_{\text{chl}} / (4C_{\text{chl}} + 8\Gamma^*)$$

where J is a function of PPFD, obtained by solving the equation:

$$0 = \theta_J J^2 - J(J_{\text{max}} + \phi_J \text{PPFD}) + J_{\text{max}} \phi_J \text{PPFD}$$

TPU-limited assimilation rate:

$$W_{\text{tpu}} = 3V_{\text{tpu}} C_{\text{chl}} / (C_{\text{chl}} - \Gamma^*)$$

<i>Symbol</i>	<i>R</i>	<i>Description</i>	<i>Units</i>	<i>Default</i>
C_{chl}	C_chl	chloroplastic CO2 concentration	Pa	input

Γ^*	gamma_star	chloroplatic CO2 compensation point (T_leaf)	Pa	calculated
J_{\max}	J_max	potential electron transport (T_leaf)	$\mu\text{mol CO}_2 / (\text{m}^2 \text{ s})$	calculated
K_C	K_C	Michaelis constant for carboxylation (T_leaf)	$\mu\text{mol} / \text{mol}$	calculated
K_O	K_O	Michaelis constant for oxygenation (T_leaf)	$\mu\text{mol} / \text{mol}$	calculated
O	O	atmospheric O2 concentration	kPa	21.27565
ϕ_J	phi_J	initial slope of the response of J to PPFD	none	0.331
PPFD	PPFD	photosynthetic photon flux density	$\mu\text{mol quanta} / (\text{m}^2 \text{ s})$	1500
R_d	R_d	nonphotorespiratory CO2 release (T_leaf)	$\mu\text{mol CO}_2 / (\text{m}^2 \text{ s})$	calculated
θ_J	theta_J	curvature factor for light-response curve	none	0.825
$V_{c,\max}$	V_cmax	maximum rate of carboxylation (T_leaf)	$\mu\text{mol CO}_2 / (\text{m}^2 \text{ s})$	calculated
V_{tpu}	V_tpu	rate of triose phosphate utilization (T_leaf)	$\mu\text{mol CO}_2 / (\text{m}^2 \text{ s})$	calculated

Value

A list of four values with units $\mu\text{mol CO}_2 / (\text{m}^2 \text{ s})$ of class units:

- W_carbox: Rubisco-limited assimilation rate
- W_regen: RuBP regeneration-limited assimilation rate
- W_tpu: TPU-limited assimilation rate
- A: minimum of W_carbox, W_regen, and W_tpu

Examples

```
bake_par = make_bakepar()
constants = make_constants(use_tealeaves = FALSE)
enviro_par = make_enviropar(use_tealeaves = FALSE)
leaf_par = make_leafpar(use_tealeaves = FALSE)
leaf_par = bake(leaf_par, enviro_par, bake_par, constants)

pars = c(leaf_par, enviro_par, constants)
C_chl = set_units(246.0161, umol / mol)
FvCB(C_chl, pars)
```

```
get_default_model      Get default model
```

Description

[Experimental]

Get the name of the default model used for different plant ecophysiological data analysis methods implemented in **photosynthesis**. Currently only used for `fit_aq_response2()` and `fit_r_light2()`.

Light response models:

- `marshall_biscoe_1980()`: Non-rectangular hyperbolic model of light responses

Usage

```
get_default_model(.photo_fun)
```

```
get_all_models(method)
```

```
marshall_biscoe_1980(Q_abs, k_sat, phi_J, theta_J)
```

Arguments

<code>.photo_fun</code>	A character string of photosynthesis function to call. One of: <code>aq_response</code> , <code>r_light</code> .
<code>method</code>	A character string of the statistical method to use: 'ls' for least-squares and 'brms' for Bayesian model using <code>brms::brm()</code> . Default is 'ls'.
<code>Q_abs</code>	Absorbed light intensity ($\mu\text{mol m}^{-2} \text{s}^{-1}$)
<code>k_sat</code>	Light saturated rate of process k
<code>phi_J</code>	Quantum efficiency of process k
<code>theta_J</code>	Curvature of the light response

Value

A character string with name of model.

Examples

```
get_default_model("aq_response")
get_default_model("r_light")
```

 gs_mod_ballberry *Stomatal conductance models*

Description

Stomatal conductance models

Usage

gs_mod_ballberry(A_net, C_air, RH)

gs_mod_leuning(A_net, C_air, D0, VPD)

gs_mod_opti(g0, g1, VPD, A_net, C_air)

gs_mod_optifull(g0, g1, gk, VPD, A_net, C_air)

Arguments

A_net	Net CO2 assimilation in $\mu\text{mol m}^{-2} \text{s}^{-1}$
C_air	CO2 concentration at the leaf surface in $\mu\text{mol mol}^{-1}$
RH	Relative humidity as a proportion
D0	Vapor pressure sensitivity of stomata (Leuning 1995)
VPD	Vapor pressure deficit (kPa)
g0	Optimization model intercept term (Medlyn et al. 2011)
g1	Optimization model slope term (Medlyn et al. 2011)
gk	Optimization model root term (Medlyn et al. 2011)

Value

gs_mod_ballberry is used for fitting the Ball et al. (1987) model of stomatal conductance

gs_mod_leuning is used for fitting the Leuning (1995) model of stomatal conductance

gs_mod_opti fits the optimal stomatal conductance model according to Medlyn et al. 2011

gs_mod_optifull fits the full optimal stomatal conductance model according to Medlyn et al. 2011

J *J: Rate of electron transport (umol/m²/s)*

Description

Calculate the rate of electron transport as a function of photosynthetic photon flux density (PPFD).

Usage

J(pars, unitless = FALSE)

Arguments

pars Concatenated parameters (leaf_par, enviro_par, and constants)
 unitless Logical. Should units be set? The function is faster when FALSE, but input must be in correct units or else results will be incorrect without any warning.

Details

J as a function of PPFD is the solution to the quadratic expression:

$$0 = \theta_J J^2 - J(J_{\max} + \phi_J \text{PPFD}) + J_{\max} \phi_J \text{PPFD}$$

Symbol	R	Description	Units	Default
J_{\max}	J_max	potential electron transport (T_leaf)	$\mu\text{mol CO}_2 / (\text{m}^2 \text{ s})$	calculated
ϕ_J	phi_J	initial slope of the response of J to PPFD	none	0.331
PPFD	PPFD	photosynthetic photon flux density	$\mu\text{mol quanta} / (\text{m}^2 \text{ s})$	1500
θ_J	theta_J	curvature factor for light-response curve	none	0.825

Value

Value in $\mu\text{mol} / (\text{m}^2 \text{ s})$ of class units

Examples

```
library(magrittr)
library(photosynthesis)

bake_par = make_bakepar()
constants = make_constants(use_tealeaves = FALSE)
enviro_par = make_enviropar(use_tealeaves = FALSE)
leaf_par = make_leafpar(use_tealeaves = FALSE)
```

```

enviro_par$T_air = leaf_par$T_leaf
leaf_par %<>% bake(enviro_par, bake_par, constants)

pars = c(leaf_par, enviro_par, constants)
J(pars, FALSE)

```

leaf_par	<i>S3 class leaf_par</i>
----------	--------------------------

Description

S3 class leaf_par

Usage

```
leaf_par(.x, use_tealeaves)
```

Arguments

.x	A list to be constructed into leaf_par .
use_tealeaves	Logical. Should leaf energy balance be used to calculate leaf temperature (T_leaf)? If TRUE, tleaf() calculates T_leaf. If FALSE, user-defined T_leaf is used. Additional parameters and constants are required, see make_parameters() .

Value

Constructor function for leaf_par class. This function ensures that leaf parameter inputs are properly formatted.

make_parameters	<i>Make lists of parameters for photosynthesis</i>
-----------------	--

Description

Make lists of parameters for photosynthesis

make_leafpar

make_enviropar

make_bakepar

make_constants

Usage

```
make_leafpar(replace = NULL, use_tealeaves)
```

```
make_enviropar(replace = NULL, use_tealeaves)
```

```
make_bakepar(replace = NULL)
```

```
make_constants(replace = NULL, use_tealeaves)
```

Arguments

replace A named list of parameters to replace defaults. If NULL, defaults will be used.

use_tealeaves Logical. Should leaf energy balance be used to calculate leaf temperature (T_leaf)? If TRUE, `tleaf()` calculates T_leaf. If FALSE, user-defined T_leaf is used. Additional parameters and constants are required, see `make_parameters()`.

Details**Constants:**

Symbol	R	Description	Units	Default
$D_{c,0}$	D_c0	diffusion coefficient for CO2 in air at 0 °C	m ² / s	1.29×10^{-5}
$D_{h,0}$	D_h0	diffusion coefficient for heat in air at 0 °C	m ² / s	1.90×10^{-5}
$D_{m,0}$	D_m0	diffusion coefficient for momentum in air at 0 °C	m ² / s	1.33×10^{-5}
$D_{w,0}$	D_w0	diffusion coefficient for water vapor in air at 0 °C	m ² / s	2.12×10^{-5}
ϵ	epsilon	ratio of water to air molar masses	none	0.622
G	G	gravitational acceleration	m / s ²	9.8
eT	eT	exponent for temperature dependence of diffusion	none	1.75
R	R	ideal gas constant	J / mol / K	8.31
σ	sigma	Stephan-Boltzmann constant	W / m ² / K ⁴	5.67×10^{-8}
f_{Sh}	f_sh	function to calculate constant(s) for Sherwood number	none	NA
f_{Nu}	f_nu	function to calculate constant(s) for Nusselt number	none	NA

Baking (i.e. temperature response) parameters:

Symbol	R	Description	Units	Default
$D_{s,gmc}$	Ds_gmc	empirical temperature response parameter	J / mol / K	487
$D_{s,Jmax}$	Ds_Jmax	empirical temperature response parameter	J / mol / K	388
E_{a,Γ^*}	Ea_gammastar	empirical temperature response parameter	J / mol	24500
$E_{a,gmc}$	Ea_gmc	empirical temperature response parameter	J / mol	68900
$E_{a,Jmax}$	Ea_Jmax	empirical temperature response parameter	J / mol	56100
$E_{a,KC}$	Ea_KC	empirical temperature response parameter	J / mol	81000
$E_{a,KO}$	Ea_KO	empirical temperature response parameter	J / mol	23700
$E_{a,Rd}$	Ea_Rd	empirical temperature response parameter	J / mol	40400
$E_{a,Vcmax}$	Ea_Vcmax	empirical temperature response parameter	J / mol	52200
$E_{a,Vtpu}$	Ea_Vtpu	empirical temperature response parameter	J / mol	52200
$E_{d,gmc}$	Ed_gmc	empirical temperature response parameter	J / mol	149000

$E_{d,Jmax}$ Ed_Jmax empirical temperature response parameter J / mol 121000

Environment parameters:

Symbol	R	Description	Units	Default
C_{air}	C_air	atmospheric CO2 concentration	umol/mol	420
O	O	atmospheric O2 concentration	mol/mol	0.21
P	P	atmospheric pressure	kPa	101
PPFD	PPFD	photosynthetic photon flux density	umol / m ² / s	1500
RH	RH	relative humidity	none	0.5
u	wind	windspeed	m / s	2

Leaf parameters:

Symbol	R	Description	Units	Default
d	leafsize	leaf characteristic dimension	m	0.1
Γ^*	gamma_star	chloroplatic CO2 compensation point (T_leaf)	umol/mol	NA
Γ^*_{25}	gamma_star25	chloroplatic CO2 compensation point (25 °C)	umol/mol	37.9
g_{mc}	g_mc	mesophyll conductance to CO2 (T_leaf)	mol / m ² / s	NA
$g_{mc,25}$	g_mc25	mesophyll conductance to CO2 (25 °C)	mol / m ² / s	0.4
g_{sc}	g_sc	stomatal conductance to CO2	mol / m ² / s	0.4
g_{uc}	g_uc	cuticular conductance to CO2	mol / m ² / s	0.01
$J_{max,25}$	J_max25	potential electron transport (25 °C)	umol / m ² / s	200
J_{max}	J_max	potential electron transport (T_leaf)	umol / m ² / s	NA
k_{mc}	k_mc	partition of g_mc to lower mesophyll	none	1
k_{sc}	k_sc	partition of g_sc to lower surface	none	1
k_{uc}	k_uc	partition of g_uc to lower surface	none	1
$K_{C,25}$	K_C25	Michaelis constant for carboxylation (25 °C)	umol / mol	268
K_C	K_C	Michaelis constant for carboxylation (T_leaf)	umol / mol	NA
$K_{O,25}$	K_O25	Michaelis constant for oxygenation (25 °C)	umol / mol	165000
K_O	K_O	Michaelis constant for oxygenation (T_leaf)	umol / mol	NA
ϕ_J	phi_J	initial slope of the response of J to PPFD	none	0.331
$R_{d,25}$	R_d25	nonphotorespiratory CO2 release (25 °C)	umol / m ² / s	2
R_d	R_d	nonphotorespiratory CO2 release (T_leaf)	umol / m ² / s	NA
θ_J	theta_J	curvature factor for light-response curve	none	0.825
T_{leaf}	T_leaf	leaf temperature	K	298
$V_{c,max,25}$	V_cmax25	maximum rate of carboxylation (25 °C)	umol / m ² / s	150
$V_{c,max}$	V_cmax	maximum rate of carboxylation (T_leaf)	umol / m ² / s	NA
$V_{tpu,25}$	V_tpu25	rate of triose phosphate utilization (25 °C)	umol / m ² / s	200
V_{tpu}	V_tpu	rate of triose phosphate utilisation (T_leaf)	umol / m ² / s	NA

If use_tealeaves = TRUE, additional parameters are:

Constants:

Symbol	R	Description	Units	Default
--------	---	-------------	-------	---------

c_p	c_p	heat capacity of air	J / g / K	1.01
R_{air}	R_air	specific gas constant for dry air	J / kg / K	287

Baking (i.e. temperature response) parameters:

Symbol	R	Description	Units	Default
--------	---	-------------	-------	---------

Environment parameters:

Symbol	R	Description	Units	Default
E_q	E_q	energy per mole quanta	kJ / mol	220
f_{PAR}	f_par	fraction of incoming shortwave radiation that is photosynthetically active radiation (PAR)	none	0.5
r	r	reflectance for shortwave irradiance (albedo)	none	0.2
T_{air}	T_air	air temperature	K	298
T_{sky}	T_sky	sky temperature	K	NA

Leaf parameters:

Symbol	R	Description	Units	Default
α_l	abs_l	absorbivity of longwave radiation (4 - 80 um)	none	0.97
α_s	abs_s	absorbivity of shortwave radiation (0.3 - 4 um)	none	0.5
g_{sw}	g_sw	stomatal conductance to H2O	mol / m ² / s	NA
g_{uw}	g_uw	cuticular conductance to H2O	mol / m ² / s	NA
$\text{logit}(sr)$	logit_sr	stomatal ratio (logit transformed)	none	NA

Optional leaf parameters:

Symbol	R	Description	Units	Default
$\delta_{\text{ias,lower}}$	delta_ias_lower	effective distance through lower internal airspace	um	NA
$\delta_{\text{ias,upper}}$	delta_ias_upper	effective distance through upper internal airspace	um	NA
A_{mes}/A	A_mes_A	mesophyll surface area per unit leaf area	none	NA
$g_{\text{liq,c,25}}$	g_liqc25	liquid-phase conductance to CO2 (25 °C)	mol / m ² / s	NA
$g_{\text{liq,c}}$	g_liqc	liquid-phase conductance to CO2 (T_leaf)	mol / m ² / s	NA
$g_{\text{ias,c,lower}}$	g_iasc_lower	internal airspace conductance to CO2 in lower part of leaf (T_leaf)	mol / m ² / s	NA
$g_{\text{ias,c,upper}}$	g_iasc_upper	internal airspace conductance to CO2 in upper part of leaf (T_leaf)	mol / m ² / s	NA

Value

make_leafpar: An object inheriting from class `leaf_par()`
 make_enviropar: An object inheriting from class `enviro_par()`
 make_bakepar: An object inheriting from class `bake_par()`
 make_constants: An object inheriting from class `constants()`

References

Buckley TN and Diaz-Espejo A. 2015. Partitioning changes in photosynthetic rate into contributions from different variables. *Plant, Cell & Environment* 38: 1200-11.

Examples

```
bake_par = make_bakepar()
constants = make_constants(use_tealeaves = FALSE)
enviro_par = make_enviropar(use_tealeaves = FALSE)
leaf_par = make_leafpar(use_tealeaves = FALSE)

leaf_par = make_leafpar(
  replace = list(
    g_sc = set_units(0.3, mol / m^2 / s),
    V_cmax25 = set_units(100, umol / m^2 / s)
  ), use_tealeaves = FALSE
)
```

parameter_names	<i>Get vector of parameter names</i>
-----------------	--------------------------------------

Description

Get vector of parameter names

Usage

```
parameter_names(which, use_tealeaves)
```

Arguments

which	A character string indicating which parameter names to retrieve: "leaf", "enviro", "bake", or "constants". Partial matching allowed.
use_tealeaves	Logical. Should leaf energy balance be used to calculate leaf temperature (T_leaf)? If TRUE, <code>tleaf()</code> calculates T_leaf. If FALSE, user-defined T_leaf is used. Additional parameters and constants are required, see make_parameters() .

Value

A character vector with parameter names associated with each type, "leaf", "enviro", "bake", or "constants".

Examples

```
parameter_names("leaf", use_tealeaves = FALSE)
```

photosynthesis *Simulate C3 photosynthesis*

Description

photosynthesis: simulate C3 photosynthesis over multiple parameter sets

photo: simulate C3 photosynthesis over a single parameter set

Usage

```
photosynthesis(  
  leaf_par,  
  enviro_par,  
  bake_par,  
  constants,  
  use_tealeaves,  
  progress = TRUE,  
  quiet = FALSE,  
  assert_units = TRUE,  
  check = TRUE,  
  parallel = FALSE,  
  use_legacy_version = FALSE  
)
```

```
photo(  
  leaf_par,  
  enviro_par,  
  bake_par,  
  constants,  
  use_tealeaves,  
  quiet = FALSE,  
  assert_units = TRUE,  
  check = TRUE,  
  prepare_for_tleaf = use_tealeaves,  
  use_legacy_version = FALSE  
)
```

Arguments

leaf_par	A list of leaf parameters inheriting class leaf_par. This can be generated using the make_leafpar function.
enviro_par	A list of environmental parameters inheriting class enviro_par. This can be generated using the make_enviropar function.
bake_par	A list of temperature response parameters inheriting class bake_par. This can be generated using the make_bakepar function.

constants	A list of physical constants inheriting class constants. This can be generated using the <code>make_constants</code> function.
use_tealeaves	Logical. Should leaf energy balance be used to calculate leaf temperature (<code>T_leaf</code>)? If TRUE, <code>tleaf()</code> calculates <code>T_leaf</code> . If FALSE, user-defined <code>T_leaf</code> is used. Additional parameters and constants are required, see <code>make_parameters()</code> .
progress	Logical. Should a progress bar be displayed?
quiet	Logical. Should messages be displayed?
assert_units	Logical. Should parameter units be checked? The function is faster when FALSE, but input must be in correct units or else results will be incorrect without any warning.
check	Logical. Should arguments checks be done? This is intended to be disabled when <code>photo()</code> is called from <code>photosynthesis()</code> Default is TRUE.
parallel	Logical. Should parallel processing be used via <code>furrr::future_map()</code> ?
use_legacy_version	Logical. Should legacy model (<2.1.0) be used? See NEWS for further information. Default is FALSE.
prepare_for_tleaf	Logical. Should arguments additional calculations for <code>tleaf()</code> ? This is intended to be disabled when <code>photo()</code> is called from <code>photosynthesis()</code> . Default is <code>use_tealeaves</code> .

Details

`photo`: This function takes simulates photosynthetic rate using the Farquhar-von Caemmerer-Berry (`FvCB()`) model of C3 photosynthesis for single combined set of leaf parameters (`leaf_par()`), environmental parameters (`enviro_par()`), and physical constants (`constants()`). Leaf parameters are provided at reference temperature (25 °C) and then "baked" to the appropriate leaf temperature using temperature response functions (see `bake()`).

`photosynthesis`: This function uses `photo` to simulate photosynthesis over multiple parameter sets that are generated using `cross_df()`.

Value

A data.frame with the following units columns

Inputs:

Symbol	R	Description	Units
$D_{c,0}$	<code>D_c0</code>	diffusion coefficient for CO2 in air at 0 °C	m^2 / s
$D_{h,0}$	<code>D_h0</code>	diffusion coefficient for heat in air at 0 °C	m^2 / s
$D_{m,0}$	<code>D_m0</code>	diffusion coefficient for momentum in air at 0 °C	m^2 / s
$D_{w,0}$	<code>D_w0</code>	diffusion coefficient for water vapor in air at 0 °C	m^2 / s
ϵ	<code>epsilon</code>	ratio of water to air molar masses	none
G	<code>G</code>	gravitational acceleration	m / s^2
eT	<code>eT</code>	exponent for temperature dependence of diffusion	none

R	R	ideal gas constant	J / mol / K
σ	sigma	Stephan-Boltzmann constant	W / m ² / K ⁴
f_{Sh}	f_sh	function to calculate constant(s) for Sherwood number	none
f_{Nu}	f_nu	function to calculate constant(s) for Nusselt number	none
$D_{s,gmc}$	Ds_gmc	empirical temperature response parameter	J / mol / K
$D_{s,Jmax}$	Ds_Jmax	empirical temperature response parameter	J / mol / K
E_{a,Γ^*}	Ea_gammapstar	empirical temperature response parameter	J / mol / K
$E_{a,gmc}$	Ea_gmc	empirical temperature response parameter	J / mol / K
$E_{a,Jmax}$	Ea_Jmax	empirical temperature response parameter	J / mol / K
$E_{a,KC}$	Ea_KC	empirical temperature response parameter	J / mol / K
$E_{a,KO}$	Ea_KO	empirical temperature response parameter	J / mol / K
$E_{a,Rd}$	Ea_Rd	empirical temperature response parameter	J / mol / K
$E_{a,Vcmax}$	Ea_Vcmax	empirical temperature response parameter	J / mol / K
$E_{a,Vtpu}$	Ea_Vtpu	empirical temperature response parameter	J / mol / K
$E_{d,gmc}$	Ed_gmc	empirical temperature response parameter	J / mol / K
$E_{d,Jmax}$	Ed_Jmax	empirical temperature response parameter	J / mol / K
C_{air}	C_air	atmospheric CO2 concentration	umol/m ³
O	O	atmospheric O2 concentration	mol/m ³
P	P	atmospheric pressure	kPa
PPFD	PPFD	photosynthetic photon flux density	umol / m ² / s
RH	RH	relative humidity	none
u	wind	windspeed	m / s
d	leafsize	leaf characteristic dimension	m
Γ^*_{25}	gamma_star25	chloroplastic CO2 compensation point (25 °C)	umol/m ³
$g_{mc,25}$	g_mc25	mesophyll conductance to CO2 (25 °C)	mol / m ² / s
g_{sc}	g_sc	stomatal conductance to CO2	mol / m ² / s
g_{uc}	g_uc	cuticular conductance to CO2	mol / m ² / s
$J_{max,25}$	J_max25	potential electron transport (25 °C)	umol / m ² / s
k_{mc}	k_mc	partition of g_mc to lower mesophyll	none
k_{sc}	k_sc	partition of g_sc to lower surface	none
k_{uc}	k_uc	partition of g_uc to lower surface	none
$K_{C,25}$	K_C25	Michaelis constant for carboxylation (25 °C)	umol / m ³
$K_{O,25}$	K_O25	Michaelis constant for oxygenation (25 °C)	umol / m ³
ϕ_J	phi_J	initial slope of the response of J to PPFD	none
$R_{d,25}$	R_d25	nonphotorespiratory CO2 release (25 °C)	umol / m ² / s
θ_J	theta_J	curvature factor for light-response curve	none
T_{leaf}	T_leaf	leaf temperature	K
$V_{c,max,25}$	V_cmax25	maximum rate of carboxylation (25 °C)	umol / m ² / s
$V_{tpu,25}$	V_tpu25	rate of triose phosphate utilization (25 °C)	umol / m ² / s
$\delta_{ias,lower}$	delta_ias_lower	effective distance through lower internal airspace	um
$\delta_{ias,upper}$	delta_ias_upper	effective distance through upper internal airspace	um
A_{mes}/A	A_mes_A	mesophyll surface area per unit leaf area	none
$g_{liq,c,25}$	g_liqc25	liquid-phase conductance to CO2 (25 °C)	mol / m ² / s
Baked Inputs:			
Symbol	R	Description	Units
-----	-----	-----	-----
Γ^*	gamma_star	chloroplastic CO2 compensation point (T_leaf)	umol/m ³
g_{mc}	g_mc	mesophyll conductance to CO2 (T_leaf)	mol / m ² / s

J_{\max}	J_max	potential electron transport (T_leaf)	umol / m
K_C	K_C	Michaelis constant for carboxylation (T_leaf)	umol / m
K_O	K_O	Michaelis constant for oxygenation (T_leaf)	umol / m
R_d	R_d	nonphotorespiratory CO2 release (T_leaf)	umol / m
$V_{c,\max}$	V_cmax	maximum rate of carboxylation (T_leaf)	umol / m
V_{tpu}	V_tpu	rate of triose phosphate utilisation (T_leaf)	umol / m
$g_{\text{liq},c}$	g_liqc	liquid-phase conductance to CO2 (T_leaf)	mol / m
$g_{\text{ias},c,\text{lower}}$	g_iasc_lower	internal airspace conductance to CO2 in lower part of leaf (T_leaf)	mol / m
$g_{\text{ias},c,\text{upper}}$	g_iasc_upper	internal airspace conductance to CO2 in upper part of leaf (T_leaf)	mol / m

Output:

A	photosynthetic rate at C_chl ($\mu\text{mol CO}_2 / \text{m}^2 / \text{s}$)
C_chl	chloroplastic CO2 concentration where A_supply intersects A_demand (mmol / mol)
C_i	intercellular CO2 concentration where A_supply intersects A_demand (mmol / mol)
g_tc	total conductance to CO2 at T_leaf ($\text{mol} / \text{m}^2 / \text{s}$)
value	A_supply - A_demand ($\mu\text{mol} / (\text{m}^2 \text{s})$) at C_chl
convergence	convergence code (0 = converged)

Examples

```
# Single parameter set with 'photo'

bake_par = make_bakepar()
constants = make_constants(use_tealeaves = FALSE)
enviro_par = make_enviropar(use_tealeaves = FALSE)
leaf_par = make_leafpar(use_tealeaves = FALSE)
photo(leaf_par, enviro_par, bake_par, constants,
      use_tealeaves = FALSE
)

# Multiple parameter sets with 'photosynthesis'

leaf_par = make_leafpar(
  replace = list(
    T_leaf = set_units(c(293.14, 298.15), "K")
  ), use_tealeaves = FALSE
)
photosynthesis(leaf_par, enviro_par, bake_par, constants,
              use_tealeaves = FALSE
)
```

Description

A table of input parameters used in `photosynthesis()`

Usage

`photo_parameters`

Format

`photo_parameters`:

A data frame with 73 rows and 11 columns:

country Country name

iso2, iso3 2 & 3 letter ISO country codes

year Year ...

Source

<https://www.who.int/teams/global-tuberculosis-programme/data>

ppm2pa

Convert pressure from PPM to Pascals

Description

Convert pressure from PPM to Pascals

Usage

`ppm2pa(ppm, P)`

Arguments

`ppm` Pressure value in umol/mol of class units

`P` Atmospheric pressure value in kPa of class units

Details

$$\text{Press}(kPa) = \text{Press}(ppm)P(kPa)$$

$$\text{Press}(Pa) = 1000\text{Press}(kPa)$$

Value

Value in Pa of class units

Examples

```
ppm = set_units(400, "umol/mol")
P = set_units(101.325, "kPa")
ppm2pa(ppm, P)
```

print_graphs	<i>Printing graphs to system</i>
--------------	----------------------------------

Description

Printing graphs to system

Usage

```
print_graphs(  
    data,  
    path,  
    output_type = "jpeg",  
    height = 5,  
    width = 5,  
    res = 600,  
    units = "in",  
    pdf_filename,  
    ...  
)
```

Arguments

data	List of graphs
path	File path for printing our graphs. Use "." to set to current working directory
output_type	Type of output file, jpeg or pdf
height	Height of jpegs
width	Width of jpegs
res	Resolution of jpegs
units	Units of height and width
pdf_filename	Filename for pdf option
...	Further arguments for jpeg() and pdf()

Value

print_graphs creates graph files in current working directory from a list of graphs

Examples

```

# Read in your data
# Note that this data is coming from data supplied by the package
# hence the complicated argument in read.csv()
# This dataset is a CO2 by light response curve for a single sunflower
data <- read.csv(system.file("extdata", "A_Ci_Q_data_1.csv",
  package = "photosynthesis"
))

# Fit many AQ curves
# Set your grouping variable
# Here we are grouping by CO2_s and individual
data$C_s <- (round(data$CO2_s, digits = 0))

# For this example we need to round sequentially due to CO2_s setpoints
data$C_s <- as.factor(round(data$C_s, digits = -1))

# To fit one AQ curve
fit <- fit_aq_response(data[data$C_s == 600, ],
  varnames = list(
    A_net = "A",
    PPFd = "Qin"
  )
)

# Print model summary
summary(fit[[1]])

# Print fitted parameters
fit[[2]]

# Print graph
fit[[3]]

# Fit many curves
fits <- fit_many(
  data = data,
  varnames = list(
    A_net = "A",
    PPFd = "Qin",
    group = "C_s"
  ),
  funct = fit_aq_response,
  group = "C_s"
)

# Look at model summary for a given fit
# First set of double parentheses selects an individual group value
# Second set selects an element of the sublist
summary(fits[[3]][[1]])

```

```
# Print the parameters
fits[[3]][[2]]

# Print the graph
fits[[3]][[3]]

# Compile graphs into a list for plotting
fits_graphs <- compile_data(fits,
  list_element = 3
)

# Print graphs to pdf
# Uncomment to run
# print_graphs(data = fits_graphs,
#               output_type = "pdf",
#               path = tempdir(),
#               pdf_filename = "mygraphs.pdf")
```

read_li6800

Read a LI-COR file

Description

[Deprecated]

We are no longer updating this function. Please use [read_licor](#) instead.

Usage

```
read_li6800(x)
```

Arguments

x File name

Value

Returns a data.frame from raw LI-COR files. Current support for LI-COR LI-6800 files only.

read_licor	<i>Read a LI-COR file</i>
------------	---------------------------

Description

[Experimental]

Reads a raw LI-COR LI6800 file, including remarks. This function was developed using output from Bluestem v.2.0.04 to v.2.1.08. We cannot guarantee backward compatibility with earlier versions of Bluestem. We will try to update code when new versions are released, but there maybe a time-lag, so inspect results carefully.

Usage

```
read_licor(
  file,
  bluestem_version = get_bluestem_version(file, n_max = 10L),
  ...
)
```

Arguments

file	Path to a raw LI6800 file
bluestem_version	Character string of Bluestem software version number. By default, the function will try to pull the version number from file.
...	Argument passed to read_lines

Value

Returns a [tibble](#) from raw LI-COR LI6800 files.

required_variables	<i>Variables required for photosynthesis models</i>
--------------------	--

Description

Variables required for **photosynthesis** models

Usage

```
required_variables(.model, quiet)
```

Arguments

.model	A character string of model name to use. See get_all_models() .
quiet	Flag. Should messages be suppressed? Default is FALSE.

simulate_error	<i>Simulate gas exchange data with measurement error</i>
----------------	--

Description

[Experimental]

Usage

```
simulate_error(
  ph_out,
  chamber_pars,
  n = 1L,
  use_tealeaves = ("T_air" %in% colnames(ph_out))
)
```

Arguments

ph_out	A data frame of output from <code>photo()</code> or <code>photosynthesis()</code> with units.
chamber_pars	A data frame with a single row of chamber parameters. See Note below for table of required parameters.
n	Integer. Number of replicated simulations per row of ph_out.
use_tealeaves	Flag. The tealeaves package uses a slightly different equation to calculate the saturating water content of air as a function temperature and pressure than LI-COR. If FALSE, the function uses LI-COR's equation in the LI6800 manual. If TRUE, it uses the tealeaves function for internal consistency. The function attempts to guess whether ph_out was run with tealeaves , but this can be manually overridden by providing a value for the argument.

Value

A data frame with $n * \text{nrow}(\text{ph_out})$ rows. It contains all the original output in ph_out as well as a column `.rep` indicating replicate number from 1 to n. Other new columns are assumed or measured chamber parameters and 'measured' values estimated from synthetic data with measurement error:

column name	assumed or derived?	description
flow	assumed	chamber flow rate
leaf_area	assumed	leaf area in chamber
sigma_CO2_r	assumed	standard deviation of measurement error in CO2_r
sigma_CO2_s	assumed	standard deviation of measurement error in CO2_s
sigma_H2O_r	assumed	standard deviation of measurement error in H2O_r
sigma_H2O_s	assumed	standard deviation of measurement error in H2O_s
c_0	derived	CO ₂ concentration before entering chamber [$\mu\text{mol} / \text{mol}$]
w_i	derived	Water vapor concentration within leaf [mmol / mol]
w_a	derived	Water vapor concentration in chamber [mmol / mol]
w_0	derived	Water vapor concentration before entering chamber [mmol / mol]

g_tw	derived	Leaf conductance to water vapor [mol/m ² /s]
E_area	derived	Evaporation rate per area [mmol/m ² /s]
E	derived	Total evaporation rate [mmol/s]
CO2_r	derived	CO ₂ concentration before entering chamber with measurement error [μ mol / mol]
CO2_s	derived	CO ₂ concentration in chamber with measurement error [μ mol / mol]
H2O_s	derived	Water vapor concentration in chamber with measurement error [mmol / mol]
H2O_r	derived	Water vapor concentration before entering chamber with measurement error [mmol / mol]
E_meas	derived	Total evaporation rate (measured) [mmol/s]
E_area_meas	derived	Evaporation rate per area (measured) [mmol/m ² /s]
g_tw_meas	derived	Leaf conductance to water vapor (measured) [mol/m ² /s]
g_sc_meas	derived	Stomatal conductance to CO ₂ (measured) [mol/m ² /s]
g_tc_meas	derived	Leaf conductance to CO ₂ (measured) [mol/m ² /s]
A_meas	derived	Net photosynthetic CO ₂ assimilation (measured) [μ mol/m ² /s]
C_i	derived	Intercellular CO ₂ concentration (measured) [μ mol/mol]

Note

The required parameters for the chamber_pars argument are:

- flow [μ mol / s]: chamber flow rate
- leaf_area [cm ^ 2]: leaf area in chamber
- sigma_CO2_s [μ mol / mol]: standard deviation of sample [CO₂] measurement error
- sigma_CO2_r [μ mol / mol]: standard deviation of reference [CO₂]
- sigma_H2O_s [mmol / mol]: standard deviation of sample [H₂O] measurement error
- sigma_H2O_r [mmol / mol]: standard deviation of sample [H₂O] measurement error

Units for flow and leaf_area should be provided; units are implied for sigma's but not necessary to specify because rnorm() drop units.

To evaluate the accuracy and precision of parameter estimation methods, it may be useful to simulate data with realistic measurement error. This function takes output from from photo() or photosynthesis() models, adds measurement error in CO₂ and H₂O concentrations, and calculates parameter estimates with synthetic data. Currently, the function assumes a simplified 1-dimensional CO₂ and H₂O conductance model: zero cuticular conductance, infinite boundary layer conductance, and infinite airspace conductance. Other assumptions include:

- chamber flow rate, leaf area, leaf temperature, and air pressure are known without error
- measurement error is normally distributed mean 0 and standard deviation specified in chamber_pars

This function was designed with the LI-COR LI6800 instrument in mind, but in principle applies to any open path gas exchange system.

[COQyjnqgugpiWjwbNIBuz5yhp7XSctzgs1-5-]: R:COQyjnqgugpiWjwbNIBuz5yhp7XSctzgs1-5-%5C

Examples

```

library(photosynthesis)

# Use photosynthesis() to simulate 'real' values
# `replace = ...` sets parameters to meet assumptions of `simulate_error()`
lp = make_leafpar(replace = list(
  g_sc = set_units(0.1, mol/m^2/s),
  g_uc = set_units(0, mol/m^2/s),
  k_mc = set_units(0, 1),
  k_sc = set_units(0, 1),
  k_uc = set_units(0, 1)
),
  use_tealeaves = FALSE)

ep = make_enviropar(replace = list(
  wind = set_units(Inf, m/s)
), use_tealeaves = FALSE)
bp = make_bakepar()
cs = make_constants(use_tealeaves = FALSE)

chamber_pars = data.frame(
  flow = set_units(600, umol / s),
  leaf_area = set_units(6, cm ^ 2),
  sigma_CO2_s = 0.1,
  sigma_CO2_r = 0.1,
  sigma_H2O_s = 0.1,
  sigma_H2O_r = 0.1
)

ph = photosynthesis(lp, ep, bp, cs, use_tealeaves = FALSE, quiet = TRUE) |>
  simulate_error(chamber_pars, n = 1L)

```

t_response_arrhenius *Temperature response functions*

Description

Temperature response functions

Usage

```

t_response_arrhenius(T_leaf, Ea)

t_response_arrhenius_kruse(dEa, Ea_ref, Par_ref, T2)

t_response_arrhenius_medlyn(T_leaf, Ea, Hd, dS)

t_response_arrhenius_topt(T_leaf, Ea, Hd, Topt)

```

`t_response_calc_dS(Ea, Hd, Topt)`

`t_response_calc_topt(Hd, dS, Ea)`

`t_response_heskel(T_leaf, a, b, c)`

`t_response_mmrt(dCp, dG, dH, T_leaf)`

Arguments

<code>T_leaf</code>	Leaf temperature in K
<code>Ea</code>	Activation energy in J mol ⁻¹ (Medlyn et al. 2002)
<code>dEa</code>	Temperature-dependent change in Ea in K ² (Kruse et al. 2008)
<code>Ea_ref</code>	Activation energy in J mol ⁻¹ (Kruse et al. 2008)
<code>Par_ref</code>	Parameter at reference temperature of 25 Celsius (Kruse et al. 2008)
<code>T2</code>	Leaf temperature term (Kruse et al. 2008)
<code>Hd</code>	Deactivation energy in J mol ⁻¹ (Medlyn et al. 2002)
<code>dS</code>	Entropy parameter in J mol ⁻¹ (Medlyn et al. 2002)
<code>Topt</code>	Optimum temperature of the process in K (Medlyn et al. 2002)
<code>a</code>	Constant to minimize residuals (Heskel et al. 2016)
<code>b</code>	Linear coefficient to minimize residuals (Heskel et al. 2016)
<code>c</code>	Quadratic coefficient to minimize residuals (Heskel et al. 2016)
<code>dCp</code>	Change in heat capacity of the enzyme between the enzyme-substrate #’ and enzyme-transition states in J mol ⁻¹ K ⁻¹ (Hobbs et al. 2013)
<code>dG</code>	Change in Gibbs free energy of the reaction at 25 C in J mol ⁻¹ (Hobbs et al. 2013)
<code>dH</code>	Change in enthalpy of the reaction at 25 C in J mol ⁻¹ (Hobbs et al. 2013)

Value

`t_response_arrhenius` calculates the rate of a process based on an Arrhenius-type curve

`t_response_arrhenius_kruse` fits a peaked Arrhenius response according to Kruse et al. 2008.

`t_response_arrhenius_medlyn` is a peaked Arrhenius response as found in Medlyn et al. 2002.

`t_response_arrhenius_topt` is a peaked Arrhenius temperature response function.

`t_response_calc_dS` calculates dS from the fitted `Topt` model.

`t_response_calc_topt` calculates `Topt` for a process from Arrhenius parameters.

`t_response_heskel` is a quadratic temperature response according to Heskel et al. 2016.

`t_response_mmrt` is a macromolecular rate theory temperature response according to Hobbs et al. 2013.
