Chapter 1

Introduction

1.1 What is Adigraph?

Adigraph is a latex library for drawing directed graphs and augmenting directed graphs, and to draw cuts over them.

It handles automatically the positioning of labels, with the exception of the horizontal position, and the inclinations of cuts.

The latest version is available on [Github](#).

Chapter 2

Setup

2.1 Installing the dependencies

Clearly you need to have texlive installed. Then, make sure you have the following packages:

fp Used for floating point calculations.

xparse Used for elaborating parameters.

xstring Used for elaborating strings.

etoolbox Used for operations on lists.

tikz Used for drawing the actual graphs.

tikz calc library Used for some internal calculations in tikz.

To be sure you can run the following, that will install the packages only if they are not already present:

```
1 | sudo tlmgr install etoolbox fp xstring
```

2.2 Installing Adigraph

You can install Adigraph, if it isn't already present in your setup, by running the following on Unix systems:

```
1 | sudo tlmgr install adigraph
```

On windows you should check on your package manager of choice (some latex distribution have a tlmgr implementation on windows too.)

Chapter 3

Usage

3.1 Creating a new graph

Here we create a new Adigraph object, called *myAdigraph*.

```
1 | \NewAdigraph{myAdigraph}{  
2 |     <nodes here, separated by semicolon>  
3 | }{  
4 |     <edges here, separated by semicolon>  
5 | }{  
6 |     <cuts here, separated by semicolon>  
7 | }[  
8 |     <edge style here>  
9 | ]
```

3.2 Changing an existing graph

You can renovate an older graph by calling \RenewAdigraph

```
1 | \RenewAdigraph{myAdigraph}{  
2 |     <nodes here, separated by semicolon>  
3 | }{  
4 |     <edges here, separated by semicolon>  
5 | }{  
6 |     <cuts here, separated by semicolon>  
7 | }[  
8 |     <edge style here>  
9 | ]
```

3.3 Adding nodes

We set its nodes with the following syntax: *node name[, textual color, border width]: x coordinate[, y coordinate][: label]*.

```
1 | \NewAdigraph{myAdigraph}{  
2 |     s:0,0;  
3 |     t:4,0;  
4 | }  
5 | \myAdigraph{}  
  
s  
t
```

3.3.1 Custom node colors

To color a node you can use the following syntax: *node name[, textual color]: x coordinate[, y coordinate]*. For example, to draw s in red and t in blue we would write:

```
1 | \NewAdigraph{myAdigraph}{  
2 |     s,red:0,0;  
3 |     t,blue:4,0;  
4 | }  
5 | \myAdigraph{}  
  
s  
t
```

Tested available colors are: red, blue, black, green. You may extend the possible colors with LaTex libraries such as xcolor.

3.3.2 Custom node width

To color a node you can use the following syntax: *node name[, textual color[, border width]]: x coordinate[, y coordinate]*. For example:

```
1 | \NewAdigraph{myAdigraph}{  
2 |     s,red,5:0,0;  
3 |     t,blue,3:4,0;  
4 | }  
5 | \myAdigraph{}  
  
s  
t
```

3.3.3 Custom node labels

To add a custom label you can use the following syntax: either *node name: x coordinate[, y coordinate][: node label]* or *node name[, textual color]: x coordinate[, y coordinate][: node label]* will work:

```

1  \NewAdigraph{myAdigraph}{  

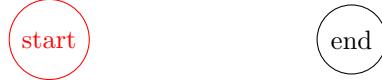

2      s,red:0,0:start;  

3      t:4,0:end;  

4  }  

5  \myAdigraph{}  

```

3.4 Automatically position nodes

When no coordinates are given or you just don't have time to think about where to put those nodes, just choose a radius and Adigraph will position them on the circle of that radius.

```

1  \NewAdigraph{myAdigraph}{  

2      1:0,0;  

3      2:2;  

4      3:2;  

5      4:2;  

6      5:2;  

7      6:2;  

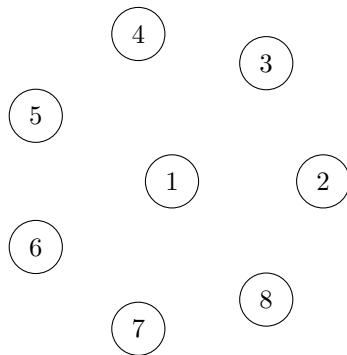

8      7:2;  

9      8:2;  

10 }  

11 \myAdigraph{}  

```

3.4.1 Colored automatically positioned nodes

```

1  \NewAdigraph{myAdigraph}{  

2      1:0,0;  

3      2,purple:2;  

4      3,brown:2;  

5      4,gray:2;  

6      5,blue:2;  

7      6,red:2;  

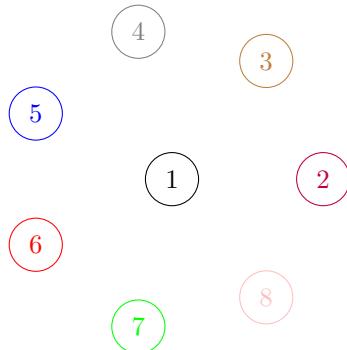

8      7,green:2;  

9      8,pink:2;  

10 }  

11 \myAdigraph{}  

```

3.5 Adding edges

We set its edges with the following syntax: *first node, second node,[color,[edge width]][:weight[:label[:label position]]]*.

3.5.1 A simple edge

```
1 \NewAdigraph{myAdigraph}{  
2     s:0,0;  
3     t:4,0;  
4 }{  
5     s,t;  
6 }  
7 \myAdigraph{}  
s --> t
```

3.5.2 A looped edge

Looped edges position automatically by themselves to minimize overlapping.

```
1 \NewAdigraph{myAdigraph}{  
2     s:0,0;  
3     t:4,0;  
4 }{  
5     s,s;  
6     t,t;  
7     s,t;  
8 }  
9 \myAdigraph{}  
s --> t
```

3.5.3 A colored simple edge

```
1 \NewAdigraph{myAdigraph}{  
2     s:0,0;  
3     t:4,0;  
4 }{  
5     s,t,red;  
6 }  
7 \myAdigraph{}  
s --> t
```

3.5.4 A wider simple edge

```
1 | \NewAdigraph{myAdigraph}{  
2 |     s:0,0;  
3 |     t:4,0;  
4 | }{  
5 |     s,t,red,5;  
6 | }  
7 | \myAdigraph{}  
8 |  
9 |
```

3.5.5 A weighted edge

```
1 | \NewAdigraph{myAdigraph}{  
2 |     s:0,0;  
3 |     t:4,0;  
4 | }{  
5 |     s,t:56;  
6 | }  
7 | \myAdigraph{}  
8 |  
9 |
```

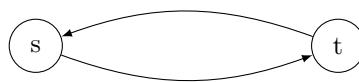

3.5.6 A weighted edge with label

```
1 | \NewAdigraph{myAdigraph}{  
2 |     s:0,0;  
3 |     t:4,0;  
4 | }{  
5 |     s,t:56:myLabel;  
6 | }  
7 | \myAdigraph{}  
8 |  
9 |
```

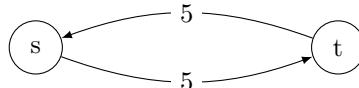

3.5.7 Edge in both directions

```
1 | \NewAdigraph{myAdigraph}{  
2 |     s:0,0;  
3 |     t:4,0;  
4 | }{  
5 |     s,t;  
6 |     t,s;  
7 | }  
8 | \myAdigraph{}  
9 |  
10|
```

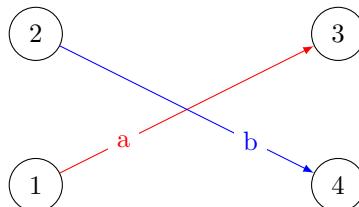

3.5.8 Edge with weights in both directions

```
1 | \NewAdigraph{myAdigraph}{  
2 |     s:0,0;  
3 |     t:4,0;  
4 | }{  
5 |     s,t:5;  
6 |     t,s:5;  
7 | }  
8 | \myAdigraph{}  
9 |  
10|
```

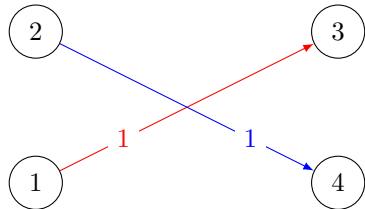

3.5.9 Positioning labels

```
1 | \NewAdigraph{myAdigraph}{  
2 |     1:0,0;  
3 |     2:0,2;  
4 |     3:4,2;  
5 |     4:4,0;  
6 | }{  
7 |     1,3,red:1:a:near start;  
8 |     2,4,blue:1:b:near end;  
9 | }  
10| \myAdigraph{}  
11|  
12|
```

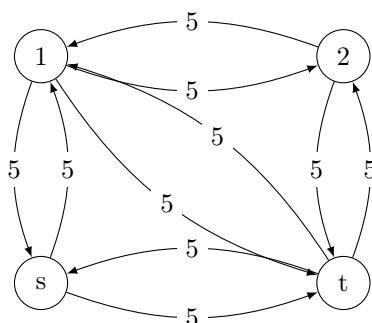

3.5.10 Positioning weights

```
1 \NewAdigraph{myAdigraph}{  
2     1:0,0;  
3     2:0,2;  
4     3:4,2;  
5     4:4,0;  
6 }{  
7     1,3,red:1::near start  
8     2,4,blue:1::near end;  
9 }  
10 \myAdigraph{}  
11 }
```

3.5.11 Multiple edges with weights

```
1 \NewAdigraph{myAdigraph}{  
2     s:0,0;  
3     t:4,0;  
4     1:0,3;  
5     2:4,3;  
6 }{  
7     s,t:5;  
8     t,s:5;  
9     s,1:5;  
10    1,s:5;  
11    1,2:5;  
12    2,1:5;  
13    2,t:5;  
14    t,2:5;  
15    t,1:5;  
16    1,t:5;  
17 }  
18 }
```

3.6 Kleene star operators

3.6.1 Kleene star on an element

This works only when you don't have a node called $j\ast_{\delta}$. When this happens, the behaviour of a tuple ja,\ast_{δ} becomes the normal one.

```

1 \NewAdigraph{myAdigraph}{  

2   1:3;  

3   2:3;  

4   3:3;  

5   4:3;  

6   5:3;  

7   6:3;  

8   7:3;  

9   8:3;  

10 }{  

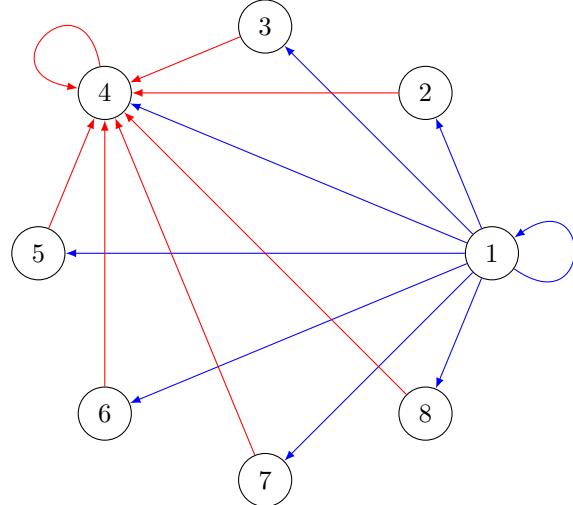

11   1,*,blue;  

12   *,4,red;  

13 }  

14 \myAdigraph{}}

```

3.6.2 Kleene star minus the element

This works only when you don't have a node called $i+\delta$. When this happens, the behaviour of a tuple $ja, +\delta$ becomes the normal one.

```

1 \NewAdigraph{myAdigraph}{  

2   1:3;  

3   2:3;  

4   3:3;  

5   4:3;  

6   5:3;  

7   6:3;  

8   7:3;  

9   8:3;  

10 }{  

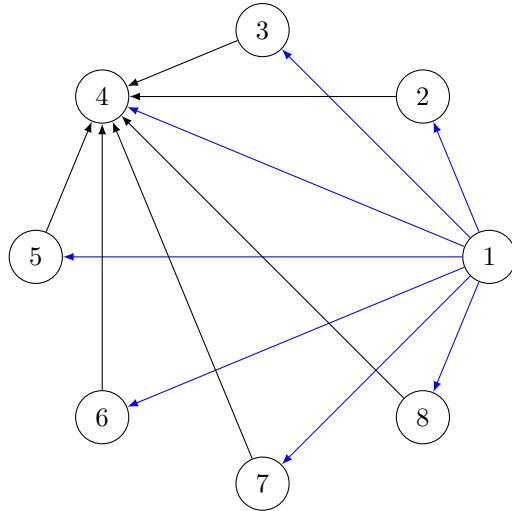

11   1,+,blue;  

12   +,4;  

13 }  

14 \myAdigraph{}}

```

3.6.3 Combining Kleene operations

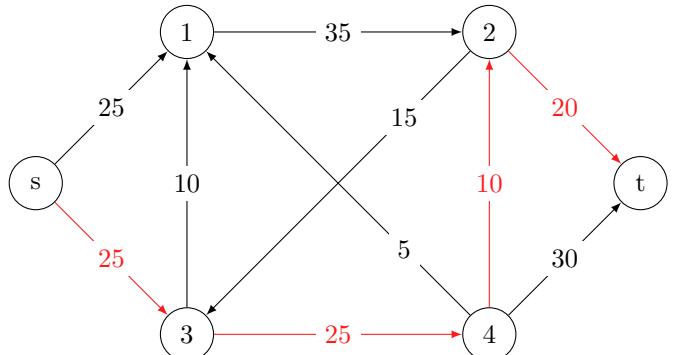

Sadly, operations such as $i^*, +\delta$ or $i^+, +\delta$ are not currently supported and not for lack of trying. I'll try implementing them again in the future when I'll have

more time.

3.7 Paths

A path is specified by the following syntax: *icomma separated list of nodesj*.

```
1 \NewAdigraph{myAdigraph}{  
2     s:0,0;  
3     1:2,2;  
4     3:2,-2;  
5     2:6,2;  
6     4:6,-2;  
7     t:8,0;  
8 }{  
9     s,1:25;  
10    s,3:25;  
11    3,4:25;  
12    1,2:35;  
13    2,t:20;  
14    4,t:30;  
15    3,1:10;  
16    4,2:10;  
17    2,3:15::near start;  
18    4,1:5::near start;  
19 }  
20 \myAdigraph{  
21     s,3,4,2,t;  
22 }
```

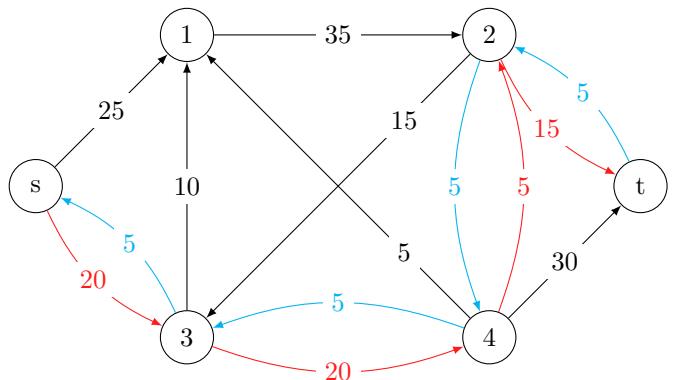

3.7.1 Augmenting paths

An augmenting path is specified by the following syntax: *icomma separated list of nodes:unitsj*. It is **very important** to note that incremental paths called upon the same object are memorized by default.

```

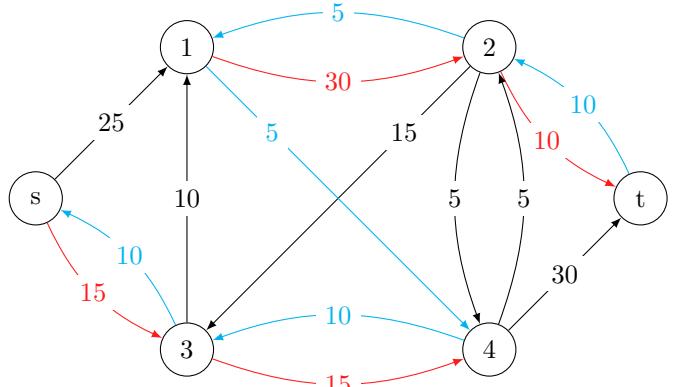

1 \NewAdigraph{myAdigraph}{
2   s:0,0;
3   1:2,2;
4   3:2,-2;
5   2:6,2;
6   4:6,-2;
7   t:8,0;
8 }
9   s,1:25;
10  s,3:25;
11  3,4:25;
12  1,2:35;
13  2,t:20;
14  4,t:30;
15  3,1:10;
16  4,2:10;
17  2,3:15::near start;
18  4,1:5::near start;
19 }
20 \myAdigraph{
21   s,3,4,2,t:5;
22 }
```

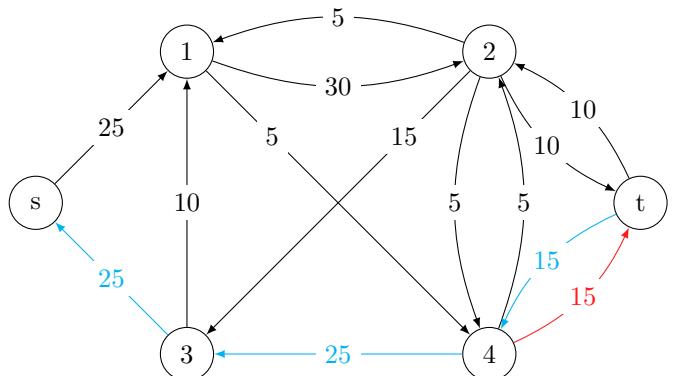

For example, suppose now we'd like to send another 5 units on the graph edited by the previous incremental path, we'll have just to write the following:

```

1 \myAdigraph{
2   s,3,4,1,2,t:5;
3 }
```

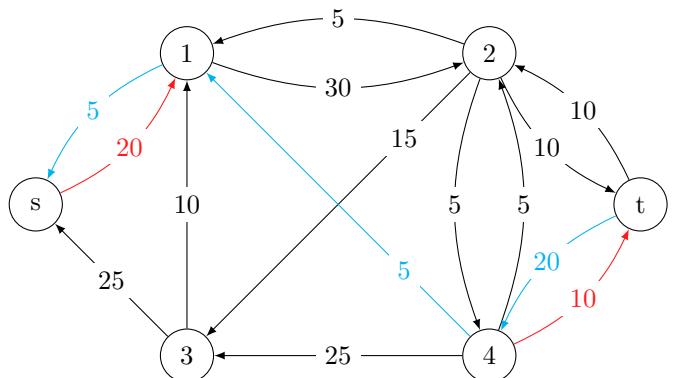

```

1 | \myAdigraph{
2 |   s,3,4,t:15;
3 |

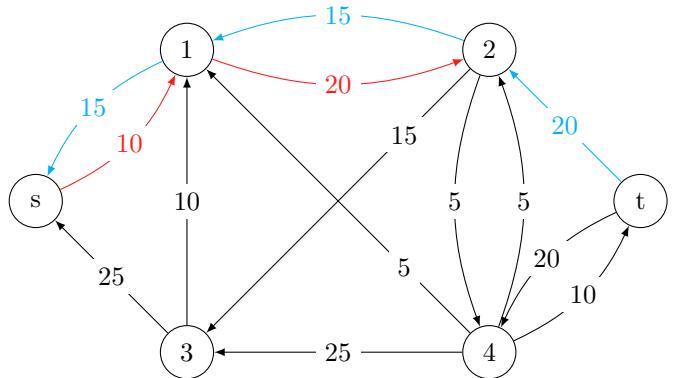

```

```

1 | \myAdigraph{
2 |   s,1,4,t:5;
3 |

```

```

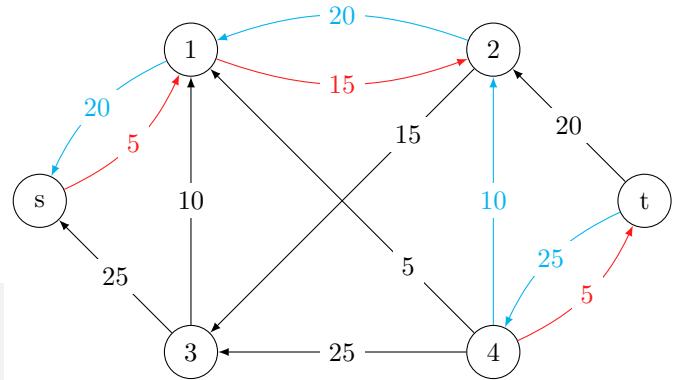

1 | \myAdigraph{
2 |   s,1,2,t:10;
3 |

```

```

1 | \myAdigraph{
2 |   s,1,2,4,t:5;
3 |

```

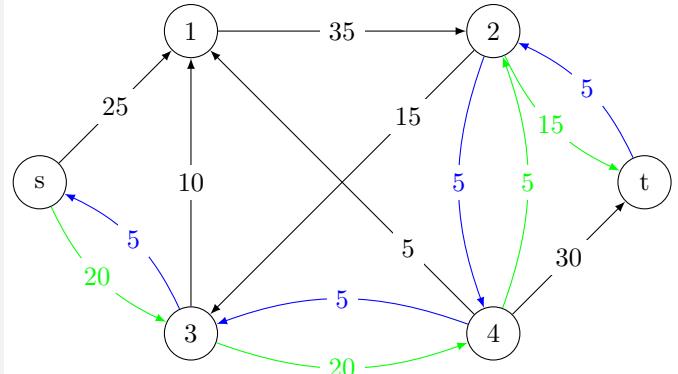

3.7.2 Custom colored augmenting Paths

A path is specified by the following syntax: *jcomma separated list of nodesj:junitsj:iforward path color, backward path colorj.*

```

1 | \NewAdigraph{myAdigraph}{ 
2 |   s:0,0;
3 |   1:2,2;
4 |   3:2,-2;
5 |   2:6,2;
6 |   4:6,-2;
7 |   t:8,0;
8 | }
9 |   s,1:25;
10 |   s,3:25;
11 |   3,4:25;
12 |   1,2:35;
13 |   2,t:20;
14 |   4,t:30;
15 |   3,1:10;
16 |   4,2:10;
17 |   2,3:15::near start;
18 |   4,1:5::near start;
19 |
20 | \myAdigraph{
21 |   s,3,4,2,t:5:green,blue;
22 |

```

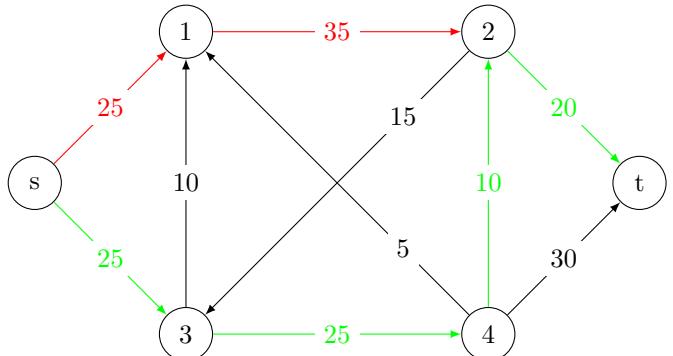

3.7.3 Custom colored Paths

A path is specified by the following syntax: *comma separated list of nodes*::*forward path color, backward path color*. Note the double colons!

```

1  \NewAdigraph{myAdigraph}{
2    s:0,0;
3    1:2,2;
4    3:2,-2;
5    2:6,2;
6    4:6,-2;
7    t:8,0;
8  }{
9    s,1:25;
10   s,3:25;
11   3,4:25;
12   1,2:35;
13   2,t:20;
14   4,t:30;
15   3,1:10;
16   4,2:10;
17   2,3:15::near start;
18   4,1:5::near start;
19 }
20 \myAdigraph{
21   s,3,4,2,t::green;
22   s,1,2::red;
23 }
```

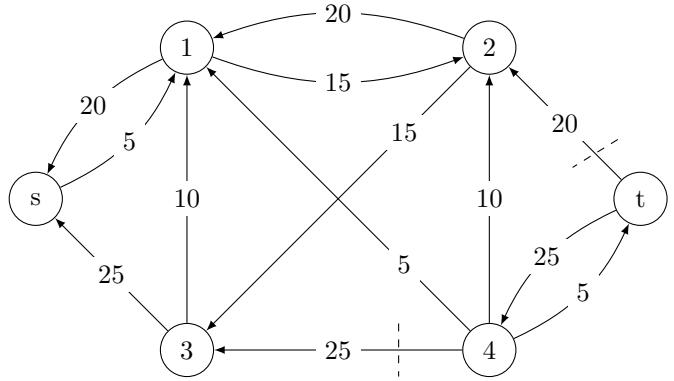

3.8 Cuts

The following is to add cuts to show minimum cuts for example, the syntax is:
first node, second node;

```

1 | \myAdigraph{}{
2 |   3,4;
3 |   2,t;
4 |

```

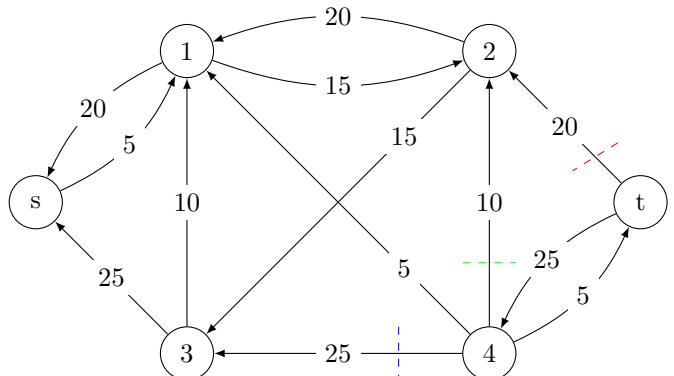

3.8.1 Colored cuts

If you'd like to color the cuts you just have to add the color as follows: *ifirst node, second node, color;*. Note that if you want to only add a cut and not an augmenting path and a cut, you still need to add the empty curly braces {}.

```

1 | \myAdigraph{}{
2 |   3,4,red;
3 |   2,t,blue;
4 |   2,4,green;
5 |

```

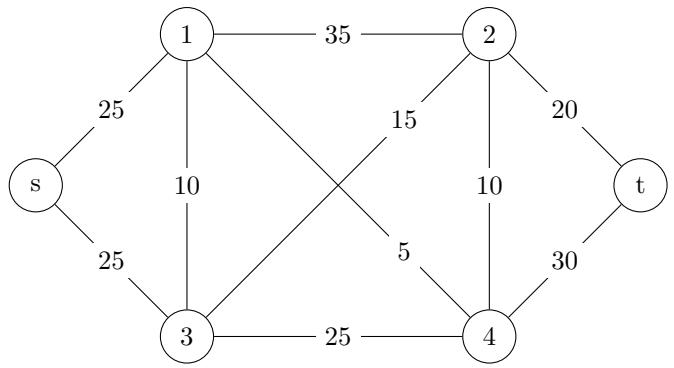

3.9 Non oriented (undirected) edges and custom edge styles

If you need non oriented edges or in general to ad a custom style to your edges you can proceed as follows:

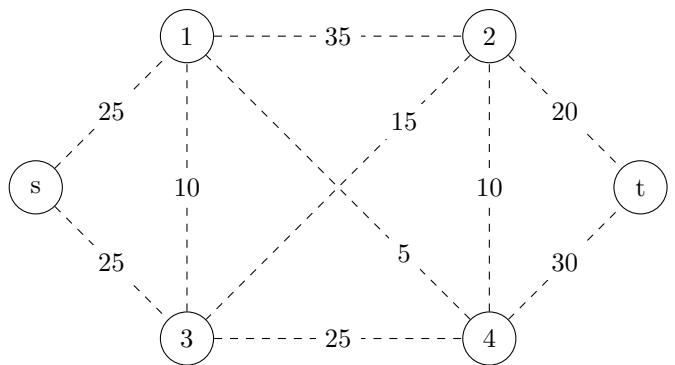

3.9.1 Non oriented (undirected)

```
1 \NewAdigraph{myCustomEdgesAdigraph}{  
2   s:0,0;  
3   1:2,2;  
4   3:2,-2;  
5   2:6,2;  
6   4:6,-2;  
7   t:8,0;  
8 }{  
9   s,1:25;  
10  s,3:25;  
11  3,4:25;  
12  1,2:35;  
13  2,t:20;  
14  4,t:30;  
15  3,1:10;  
16  4,2:10;  
17  2,3:15::near start;  
18  4,1:5::near start;  
19 }[-]  
20 \myCustomEdgesAdigraph{}
```

3.9.2 Dashed

```
1 \NewAdigraph{myCustomEdgesAdigraph}{  
2     s:0,0;  
3     1:2,2;  
4     3:2,-2;  
5     2:6,2;  
6     4:6,-2;  
7     t:8,0;  
8 }{  
9     s,1:25;  
10    s,3:25;  
11    3,4:25;  
12    1,2:35;  
13    2,t:20;  
14    4,t:30;  
15    3,1:10;  
16    4,2:10;  
17    2,3:15::near start;  
18    4,1:5::near start;  
19 }[dashed]  
20 \myCustomEdgesAdigraph{}
```

Chapter 4

PyAdigraph

[Pyadigraph](#) turns your networkx into Adigraph latex package. It requires Adigraph (1.7.0+) to work.

4.1 Installation

The package can be installed by simply running:

```
1 | pip install pyadigraph
```

4.2 Example

4.2.1 Python code

For example by running the following python code:

```
1  from pyadigraph import Adigraph
2  import networkx as nx
3
4  A = Adigraph(
5      vertices_colorFallback="gray!90",
6      edges_colorFallback="gray!90",
7      subCaption="My adigraph number {i} of {n}",
8      subLabel="adigraph_{i}_{n}",
9      rowSize=1,
10     caption="A graph generated with python and latex.",
11     label="pyadigraph_example"
12 )
13
14 A.addGraph(
15     nx.bipartite.random_graph(4, 4, 1),
16     verticesColor={
17         0: 'red!90',
18         1: 'red!90',
19         4: 'cyan!90',
20         7: 'cyan!90'
21     })
22
23 A.save("test/result.tex", document=True)
```

4.2.2 Latex result

You automatically obtain the following latex:

```
1 \documentclass{report}
2 \usepackage{adigraph}
3 \usepackage{subcaption}
4
5 \begin{document}
6 \begin{figure}
7   \begin{subfigure}{1.0\textwidth}
8     \NewAdigraph{myAdigraph}{  

9       0,red!90,:-0.4386601404141742\textwidth,0.2091077552922947\textwidth:;  

10      1,red!90,:-0.15708496776680972\textwidth,0.09630690244229406\textwidth:;  

11      2,gray!90,:0.43887677279554366\textwidth,-0.2079924280020609\textwidth:;

38    \caption{A graph generated with python and latex.}\label{pyadigraph_example}
39  \end{figure}
40 \end{document}
```

And once you compile that you receive a graph like the following:

(a) My adigraph number 1 of 1

Figure 1: A graph generated with python and latex.

Chapter 5

Utilities

If for some reason you need to disable all the adigraphs in your latex code, for example using an online editor such as Overleaf that allows only a given maximum compile time, you can use the following command:

```
1 | \DisableAdigraphs
```

You can then re-enable adigraphs with:

```
1 | \EnableAdigraphs
```

Chapter 6

Warnings

6.1 Reserved words

I reserve to use for the package the following tokens:

1. \Adigraph
2. \AdigraphBuildEdge
3. \AdigraphBuildEdgeWrapper
4. \AdigraphBuildNode
5. \AdigraphBuildNodeWrapper
6. \AdigraphBuildPath
7. \AdigraphCalculateOrientation
8. \AdigraphCountPaths
9. \AdigraphCutBuilder
10. \AdigraphDrawEdge
11. \AdigraphDrawNode
12. \AdigraphEdgeBuilder
13. \AdigraphEdgeDrawer
14. \AdigraphElaboratePath
15. \AdigraphExecuteCutBuilder
16. \AdigraphGenerateNodeName
17. \AdigraphMemorizeEdge
18. \AdigraphMemorizeNode
19. \AdigraphNodeBuilder
20. \AdigraphNodeCounter
21. \AdigraphNodeCounterSecondWrapper
22. \AdigraphNodeCounterWrapper
23. \AdigraphNodesCounter
24. \AdigraphPathBuilder
25. \AdigraphProcessAugmentingPaths
26. \AdigraphProcessAugmentingPathsList
27. \AdigraphProcessCuts
28. \AdigraphProcessEdges
29. \AdigraphProcessNodes
30. \AdigraphProcessPaths
31. \AdigraphSimpleSum
32. \NewAdigraph
33. \RenewAdigraph
